

Weekly Flood Situation Report for the Mekong River Basin

Prepared on: 06/06/2011, covering the week from the 1st June to the 5th June 2011

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of the 1st June to the 5th June 2011, five weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather charts of the 1st June and the 5th June bulletins are presented in the figures below:

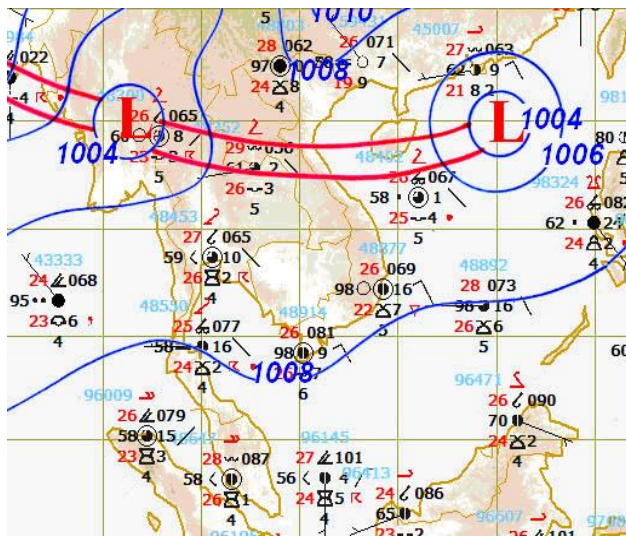

Figure 1: Weather map for 1st June 2011

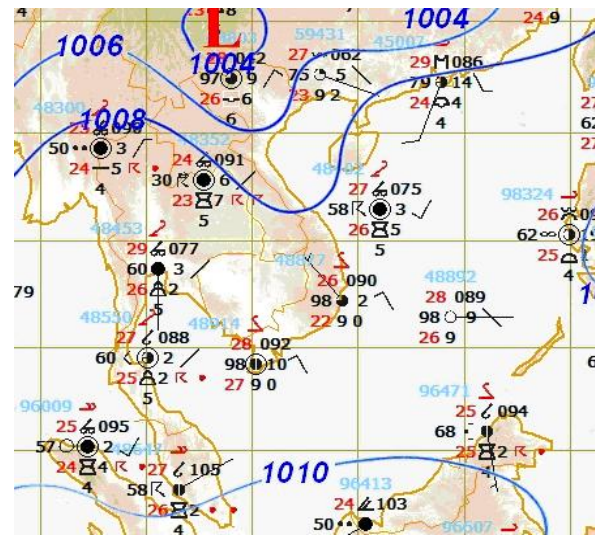

Figure 2: Weather map for 5th June 2011

Moderate South-West (SW) Monsoon

Moderate SW monsoon prevailed over Andaman Sea, the Gulf of Thailand, Thailand and Cambodia from 1st June and almost stationary in whole week (Figure 1 and 2).

Inter Tropical Convergence Zone (ITCZ)

During last week, Inter Tropical Convergence Zone (ITCZ) laid across Myanmar, Thailand, Lao PDR and Viet Nam on the 1st and 2nd of June (Figure 1).

Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No Tropical Storm (TS) was observed in last week.

Other weather phenomena that affect the discharge

No other weather phenomena affecting the discharge were observed.

Over weather situation

A normal weather situation lasted during last week. As the result of the appearances of moderate SW monsoon and ITCZ, scattered to moderate thundershower were occurred in upper and middle parts of Thailand, Lao PDR, Vietnam, some areas in Cambodia during the 1st and the 2nd of June, thundershower with isolate heavy rain in Central of Thailand, Lao PDR, Cambodia and Viet Nam during the end of the week.

General behaviour of the Mekong River

Water levels at most stations along Lower Mekong River were recording levels that are somewhat above and around the long-term average except Tan Chau and Chau Doc. Water levels at stations in upper reach show a slightly rising trend while water levels at stations in the middle and lower reaches were more-or-less stable during the end of the week. Regarding to 2 stations in downstream at Tan Chau and Chau Doc, water levels at those 2 stations were fluctuated by tidal with a falling trend toward the end of the week.

For stations from Chiang Saen to Paksane

Water levels were more-or-less stable, slightly rising towards the end of the week. Most stations were recording levels that are somewhat above the long-term average for this time of the year.

For stations from Nakon Phanon/Thakphet to Pakse

Water levels were more or less stable during last week. Most stations were recording levels that are somewhat around the long-term average for this time of the year.

For stations from Stung Treng to Kampong Cham

Water levels were more or less stable with a slightly falling trend towards the end of the week. Most stations are somewhat above the long-term average for this time of the year.

For stations from Phnom Penh to Koh Khel/Neak Luong

Water levels were more or less stable during last week. Most stations were recording levels that are somewhat above the long-term average for this time of the year.

Tan Chau and Chau Doc

Water levels were falling towards the end of the week. Both stations were recording levels that are somewhat below the long-term average for this time of the year and significantly affected by tidal.

Note: for areas between forecast stations, please refer to the nearest forecast station.

Flood Situation

▪ Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the past week. Water levels are still significantly below flood levels (as defined by the national agency) at all forecast stations.

▪ Damage or victims:

No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the past week.

For more details see the following annex:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex B: Accuracy and performance

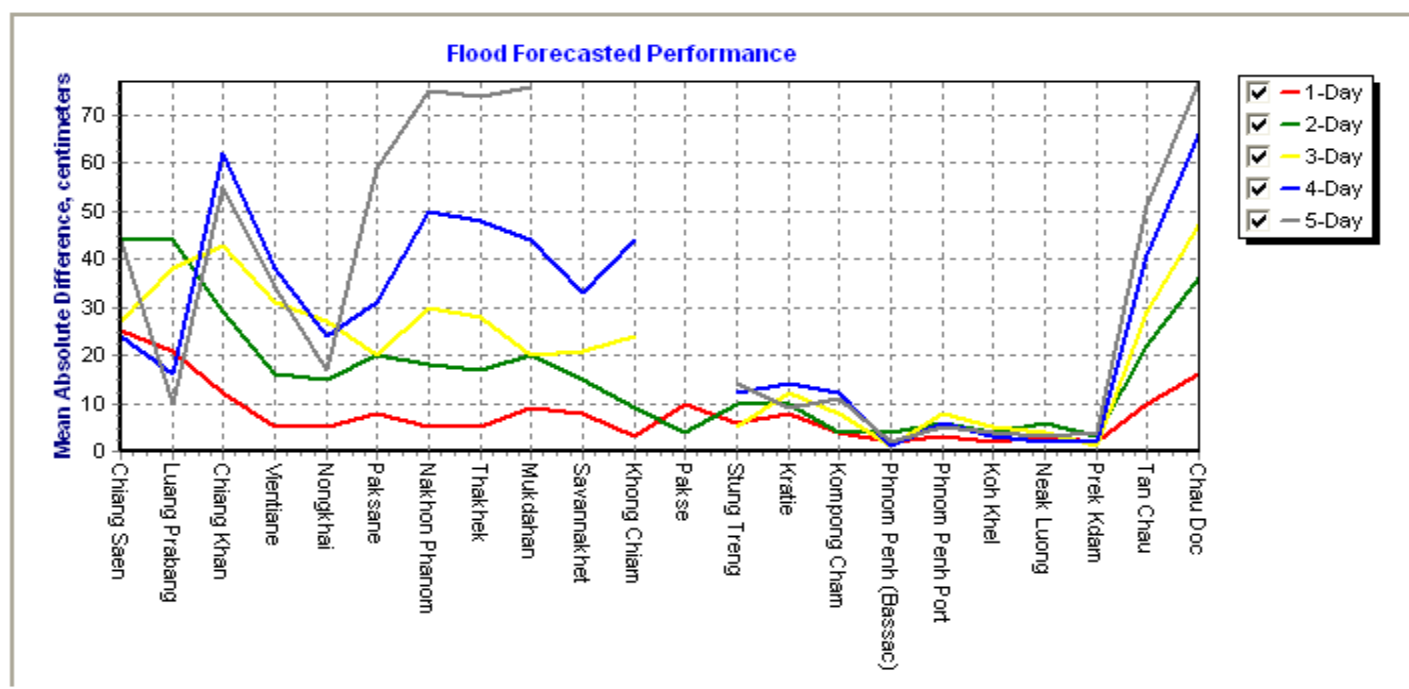

Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

The graph of average difference between forecast and actual water levels for the past week shows the unusual pattern during transitional period between dry and wet season, in which the accuracy at tidal affected stations Tan Chau and Chau Doc is less accurate than expected.

In general the overall accuracy is good for 1-day to 5-day forecasts at stations in middle and lower reaches of LMB from Pakse to Prek Dam. The less expected accuracy at downstream stations caused by internal model functionality in forecasting for tidal influence stations.

Figure B1: Average flood forecast accuracy along the Mekong mainstream

Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

unit in %

	Chiang Saen	Luang Prabang	Chiang Khan	Vientiane	Nongkhai	Paksane	Nakhon Phanom	Thakhek	Mukdahan	Savannakhet	Khong Chiam	Pakse	Stung Treng	Kratie	Kompong Cham	Phnom Penh (Bassac)	Phnom Penh Port	Koh Khel	Neak Luong	Prek Kdam	Tan Chau	Chau Doc	Average

Note: An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

	Flood Forecast: time sent				Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)	Weather information available (number)	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
