Weekly Flood Situation Report for the Mekong River Basin
Prepared at: 25/08/2014, covering the week from the 18th to 25th August 2014

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of 18th to 25th August 2014 three weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps of the 18th August and 22nd August 2014 are presented in the Figures 1 and 2 below:

Figure 1: Weather map for 18th August 2014
Figure 2: Weather map for 22nd August 2014

Moderate South-West (SW) Monsoon

During last week, the Southwest monsoon was prevailed over Myanmar, the Andaman Sea, the Gulf of Thailand, Thailand and Indochina Peninsular (Figure 1 and Figure 2)

Inter Tropical Convergence Zone (ITCZ)

During last week, the Inter Tropical Convergence Zone (ITCZ) lies across the lower North of Myanmar, Lao PDR and the middle Viet Nam.

No TD, TS or TY was observed during last week.

Over weather situation

During last week, there are two factors weather affecting to LMB; the Inter Tropical Convergence Zone (ITCZ) and moderate Southwest Monsoon (SW). However, their influencing on rainfall was not much. The accumulative weekly rainfall greater than 100 mm are at Nongkhai (115 mm) and Savannakhet (122.5 mm). See Table A2 and Figure 3.
Figure 3: Weekly Rainfall Distribution from 18th – 25th August 2014 over the LMB
**General behaviour of the Mekong River**

During last week, the water levels at most stations from upper reach of the LMB to Pakse were fluctuating below the Long Term Average (LTA); from Stung Treng to Kompong Cham were decreasing below the LTA A and from Phnom Penh to Chau Doc were decreasing and just above/below the LTA.

**For stations from Chiang Saen and Luang Prabang**

Compared to the long term average (LTA), the water levels at these stations were fluctuating below the LTA.

**For stations from Chiang Khan, Vientiane and Nongkhai and Paksane**

Compared to the long term average (LTA), the water levels at these stations were fluctuating below the LTA.

**For stations from Thakhet/Nakhon Phanom to Pakse**

Compared to the long term average (LTA), the water levels at these stations were fluctuating below the LTA.

**For stations from Stung Treng to Kompong Cham**

Compared to the long term average (LTA), the water levels at these stations were decreasing below the LTA.

**For stations from Phnom Penh to Koh Khel/Neak Luong**

Compared to the long term average (LTA), the water levels at these stations were decreasing; however at Phnom Penh (Bassac) and Neak Luong, the water levels were just above the LTA, at Phnom Penh Port and Prek Kdam were just below the LTA from mid – last week.

**Tan Chau and Chau Doc**

Compared to the long term average (LTA), the water levels at both stations were decreasing; however, the water level at Chau Doc was just above the LTA, while at Tan Chan was below the LTA from mid – last week.

**Note:** For areas between forecast stations, please refer to the nearest forecast station.

**Flood Situation**

- Flood stage or alarm stage:

  No alarm stage (where the forecast is expected to reach flood level within the next three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

- Damage or victims:

  No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the last week.

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex B: Accuracy and performance

Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is fairly good for 1-day to 5-day forecast lead time at stations in the lower parts of the LMB. However, the accuracies at Nakhon Phanom, Khong Chiam, Kratie, Kompong Cham for 3-day to 5-day forecast were less than expected.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge.

![Figure B1: Average flood forecast accuracy along the Mekong mainstream](image-url)
**Forecast Achievement**

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

Unit in cm

**Note:** An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (http://ffw.mrcmekong.org/accuracy.htm).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.
Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date
