

Weekly Flood Situation Report for the Mekong River Basin

Prepared at: 20/10/2014, covering the week from the 13th October to the 20th October 2014

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of 13th October to 20th October 2014 eight weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps of the 13th October and 19th October 2014 are presented in the Figures 1 and 2 below:

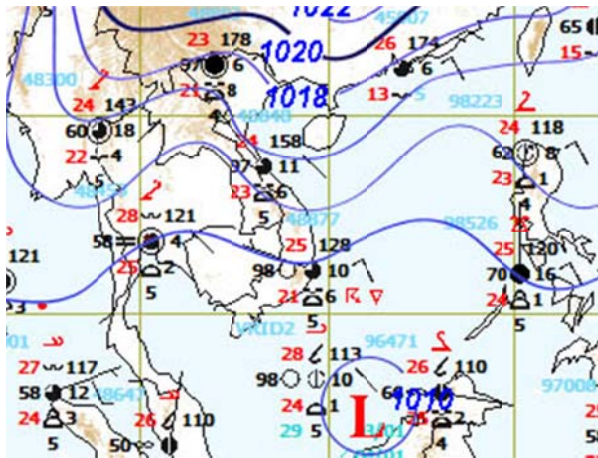

Figure 1: Weather map for 13th October 2014

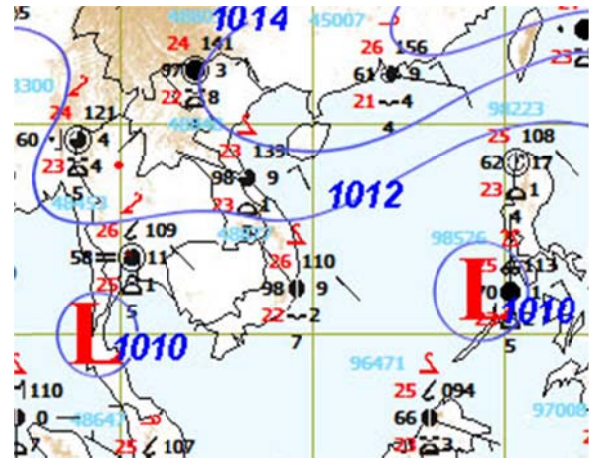

Figure 2: Weather map for 19th October 2014

Moderate South-West (SW) Monsoon

No South-West Monsoon was active during last week. (see Figures 1 and 2 above).

Inter Tropical Convergence Zone (ITCZ)

The Inter Tropical Convergence Zone (ITCZ) laid across the South of Thailand, the Gulf of Thailand and the lower South Cambodia and the South of Viet Nam at the beginning of last week.

Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No TD, TS or TY was observed during last week.

Other weather phenomena that affect the discharge

Trough of low pressure laid across the South of Thailand, Cambodia and the South of Viet Nam at the beginning and ending of last week followed by the ridge laid across Myanmar, Thailand and Indochina Peninsular at the surface till the end of last week.

Over weather situation

The weather of the last week was influenced by the Inter Tropical Convergence Zone (ITCZ) and trough of low pressure then followed by the ridge during last week as mention above. Therefore, medium and heavy scatter rainfalls had happened in some areas in the lower reaches of LMB. The accumulative weekly rainfall greater than 50 mm. are at Kratie (74.1 mm.), Koh Khel (84.5 mm.), Prek Kdam (91.1 mm.), Tan Chau (70.6 mm.) and Chau Doc (61.3 mm.). See Table A2 and Figure 3.

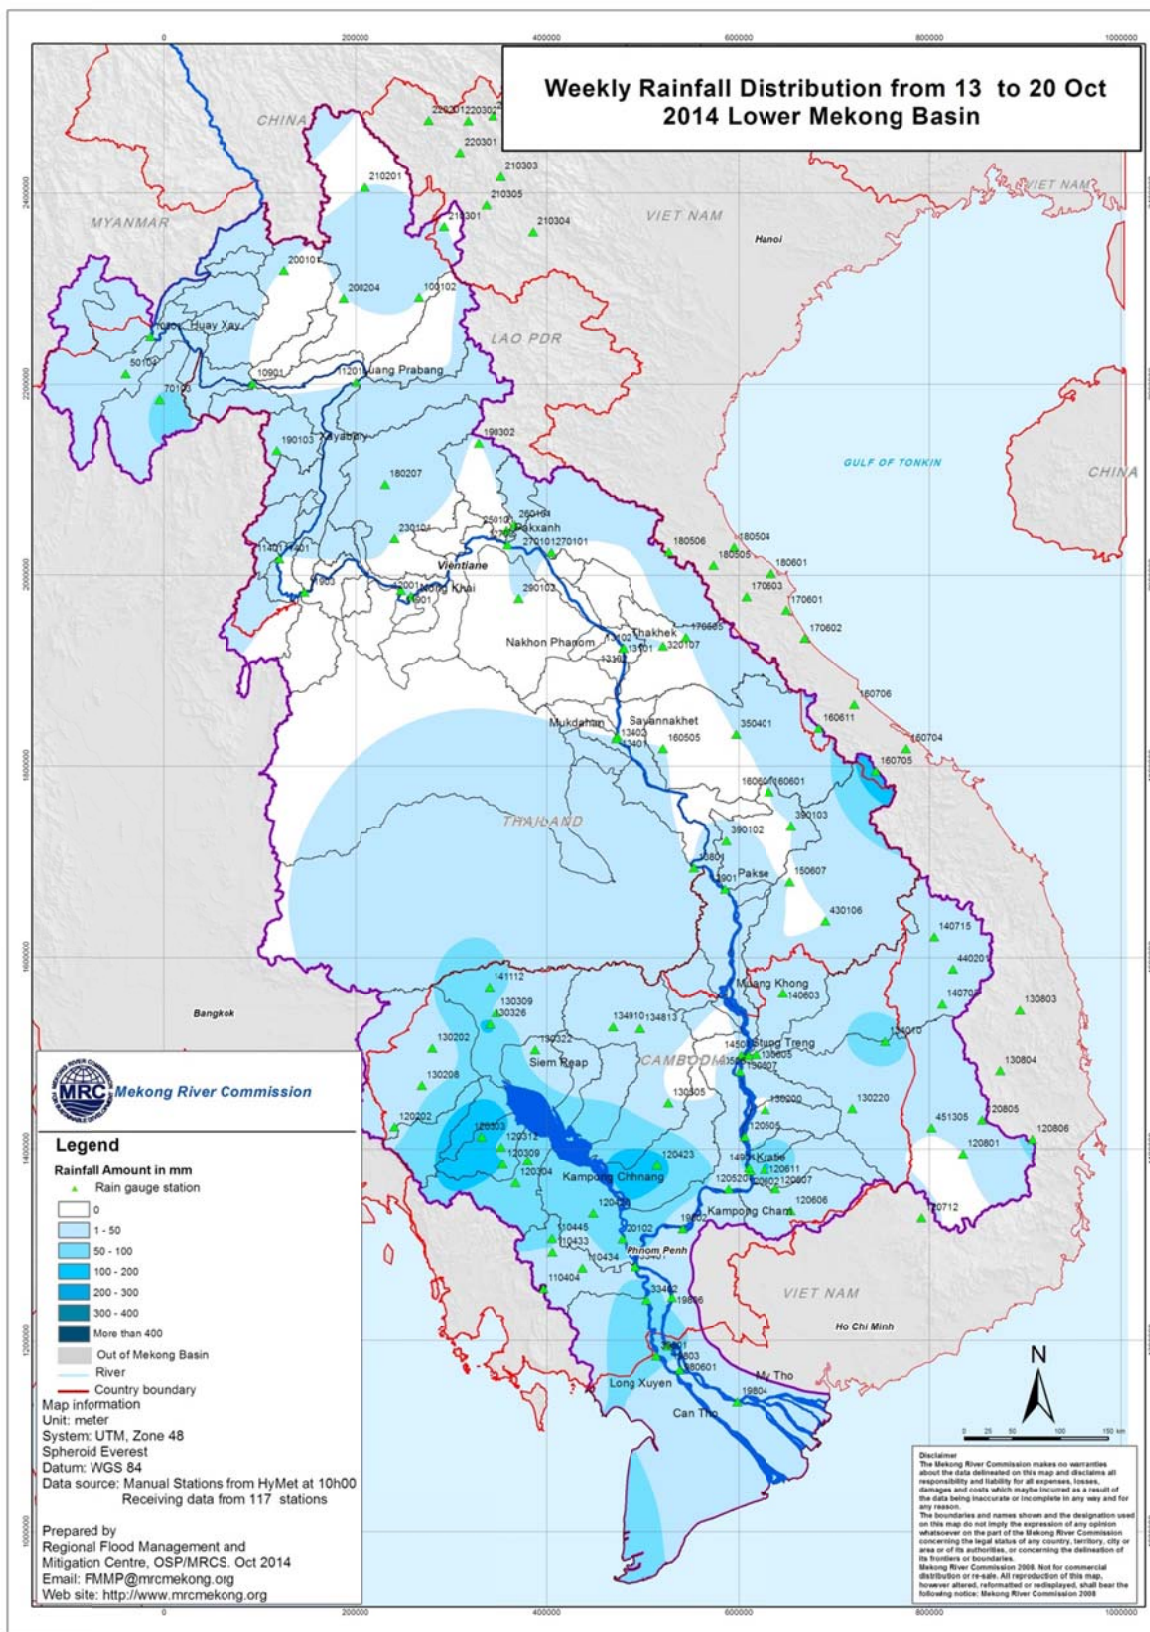

Figure 3: Weekly Rainfall Distribution from 13th - 20th October 2014 over the LMB

General behaviour of the Mekong River

During the last week, the water levels at all stations in LMB were recessing below the Long Term Average (LTA).

For stations from Chiang Saen and Luang Prabang

Compared to the long term average (LTA), the water levels at these stations were stable and recessing below the LTA respectively.

For stations from Chiang Khan, Vientiane and Nong Khai and Paksane

Compared to the long term average (LTA), the water levels at these stations were recessing below the LTA.

For stations from Thakhet/Nakon Phanom to Pakse

Compared to the long term average (LTA), the water levels at these stations were recessing below the LTA.

For stations from Stung Treng to Kompong Cham

Compared to the long term average (LTA), the water levels at these stations were recessing below the LTA.

For stations from Phnom Penh to Koh Khel/Neak Luong

Compared to the long term average (LTA), the water levels at these stations were recessing below the LTA.

Tan Chau and Chau Doc

Compared to the long term average (LTA), the water levels at these stations were recessing below the LTA.

Note: For areas between forecast stations, please refer to the nearest forecast station.

Flood Situation

- Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

For more details see the following annex:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex A: Graphs and Tables

Annex B: Accuracy and performance

Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is quite good for 1-day to 5-day forecast lead time at stations

in the LMB. However, the accuracies at Phnom Penh (Bassac) and Koh Khel for 3 to 5-day forecast were less than expected.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge.

Figure B1: Average flood forecast accuracy along the Mekong mainstream

Remark: For Thailand mainstream stations only three (03) day forecasts are presented

Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

Unit in %

	Chiang Saen	Luang Prabang	Chiang Khan	Vientiane	Nongkhai	Paksane	Nakhon Phanom	Thakhek	Mukdahan	Savannakhet	Khong Chiam	Pakse	Stung Treng	Kratie	Kompong Cham	Phnom Penh (Bassac)	Phnom Penh Port	Koh Khel	Neak Luong	Prek Kdam	Tan Chau	Chau Doc	Average

Note: An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

	Flood Forecast: time sent			Weather information available (number)	Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)		NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
