

### Weekly Flood Situation Report for the Mekong River Basin

Prepared at: 26/10/2015, covering the week from the 19<sup>th</sup> October to the 26<sup>th</sup> October 2015

### Weather Patterns, General Behaviour of the Mekong River and Flood Situation

#### General weather patterns

During the week of 19<sup>th</sup> October to 26<sup>th</sup> October 2015 four weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps of the 13<sup>th</sup> October and 18<sup>th</sup> October 2015 are presented in the Figures 1 & 2 below:

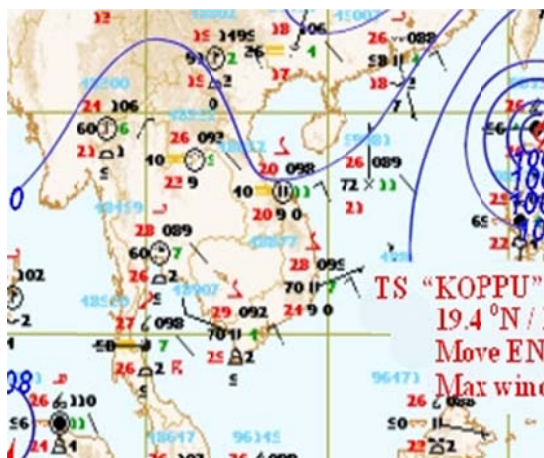

Figure 1: Weather map for 20<sup>th</sup> October 2015

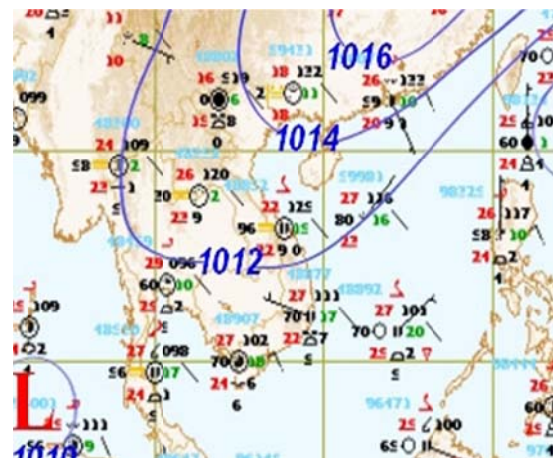

Figure 2: Weather map for 23<sup>rd</sup> October 2015

#### Moderate South-West (SW) Monsoon

No Southwest monsoon was observed last week.

#### Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

Tropical storms "KOPPU" was observed last week but had no influence on LMB.

#### Other weather phenomena that affect the discharge

The weak trough lies across Myanmar, Thailand Lao PDR, the North of Cambodia, the Central and the North of Viet Nam. The North-easterly winds prevail over Thailand and Indochina Peninsular at the height of 1.5km (850 hPa); and the ridge lies across Myanmar, Thailand Lao PDR, the North of Cambodia, the Central and the North of Viet Nam.

#### Over weather situation

During the last week, the weather was influenced by North-easterly winds and weak trough of low pressure system. Therefore, less scatter rain occurred in the Mekong River Basin during last week; see Figure 3 and Table A2

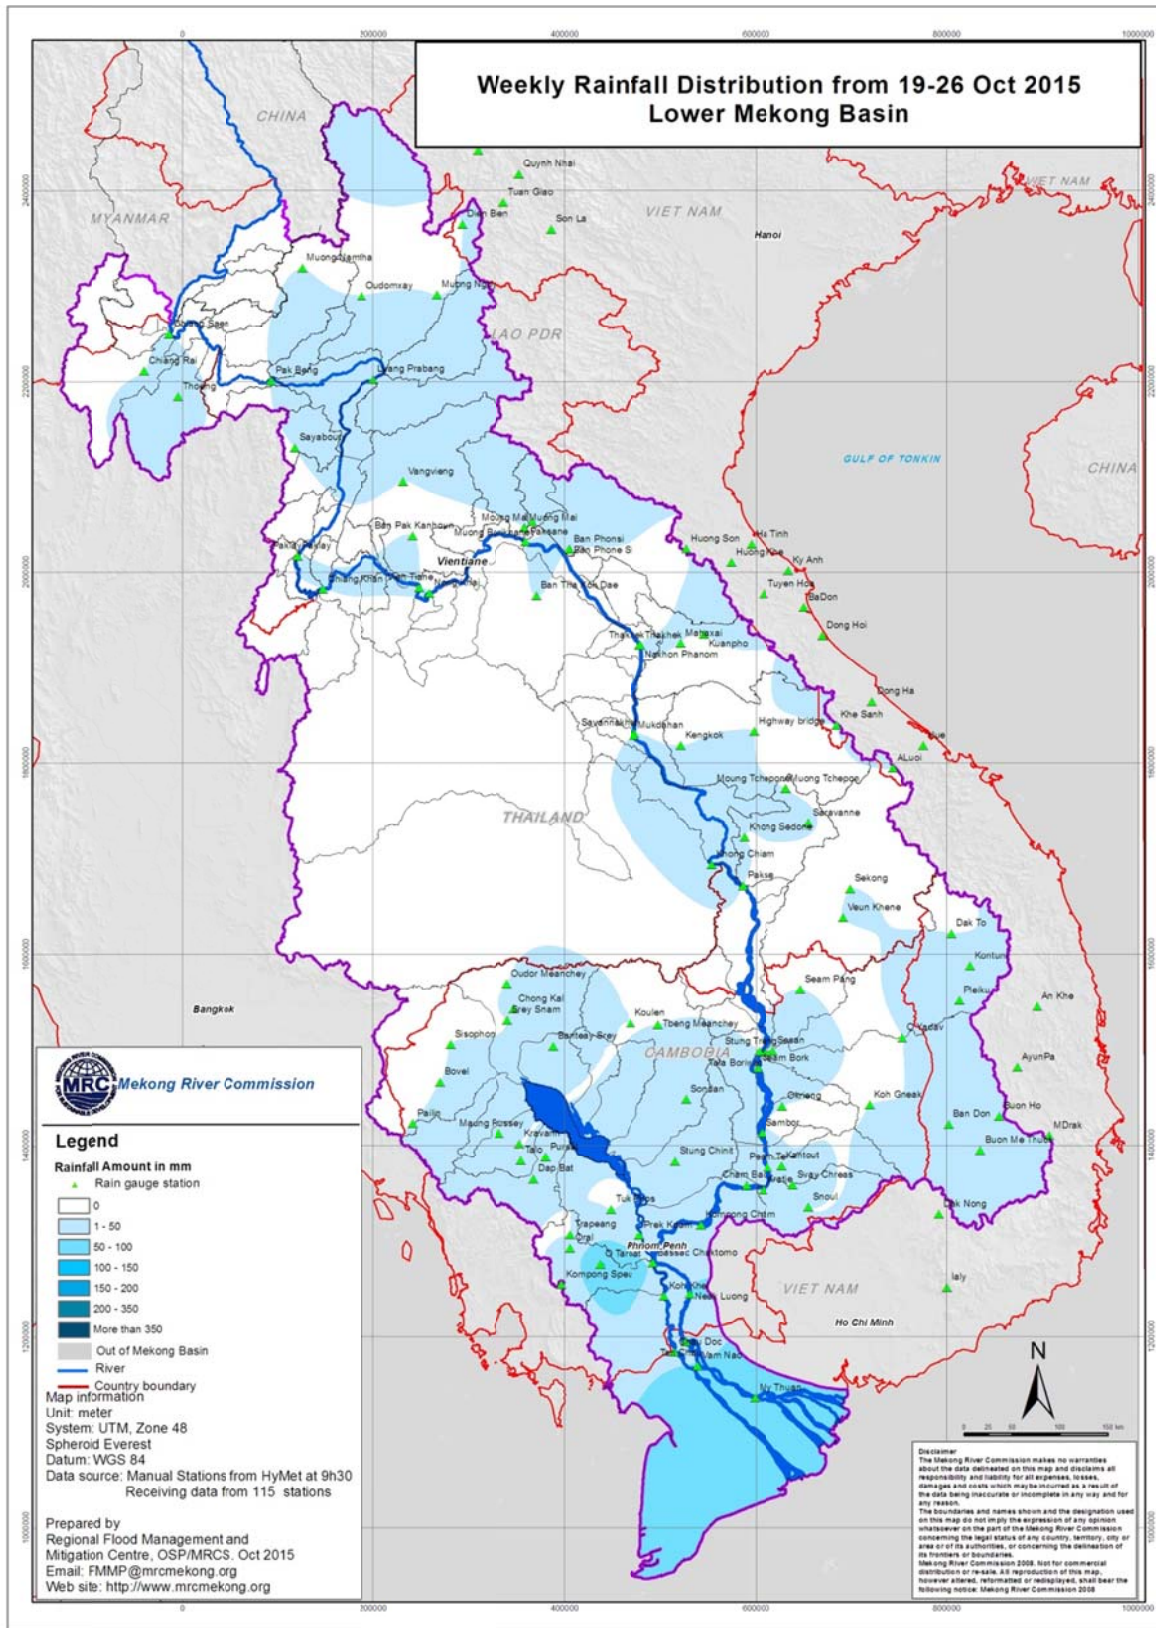

Figure 3: Weekly Rainfall Distribution over the LMB from 19<sup>th</sup> October - 26<sup>th</sup> October 2015

### **General behaviour of the Mekong River**

During last week, the water levels at most stations in the LMB were recessed below the Long Term Average (LTA), except Tan Chau and Chau Doc were rising below the LTA.

#### ***For stations from Chiang Saen and Luang Prabang***

Compared to the long term average (LTA), during last week the water levels at these stations were recessing below the LTA, except Chiang Saen that was fluctuating below the LTA.

#### ***For stations from Chiang Khan, Vientiane and Nong Khai and Paksane***

Compared to the long term average (LTA), during last week the water levels at these stations were recessing below the LTA.

#### ***For stations from Thakhet/Nakon Phanom to Pakse***

Compared to the long term average (LTA), during last week the water levels at these stations were recessing below the LTA.

#### ***For stations from Stung Treng to Kompong Cham***

Compared to the long term average (LTA), during last week the water levels at these stations were recessing below the LTA.

#### ***For stations from Phnom Penh to Koh Khel/Neak Luong***

Compared to the long term average (LTA), during last week the water levels at these stations were recessing below the LTA.

#### ***Tan Chau and Chau Doc***

Compared to the long term average (LTA), during last week the water levels at these stations were rising below the LTA.

**Note:** For areas between forecast stations, please refer to the nearest forecast station.

### **Flood Situation**

- Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

- Damage or victims:

No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the last week.

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

## Annex A: Graphs and Tables

Table A1: observed water levels

## Annex B: Accuracy and performance

### Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is quite good for 1-day to 5-day forecast lead time at stations

in the upper and lower parts of the LMB. However, the accuracies at middle reach of the LMB stations as Nakhon Phanom to Khong Chiam and Kratie for 3-day to 5-day forecast were less than expected.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge.

Figure B1: Average flood forecast accuracy along the Mekong mainstream

### Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

Unit in %

	Chiang Saen	Luang Prabang	Chiang Khan	Vientiane	Nongkhai	Paksane	Nakhon Phanom	Thakhek	Mukdahan	Savannakhet	Khong Chiam	Pakse	Stung Treng	Kratie	Kompong Cham	Phnom Penh (Bassac)	Phnom Penh Port	Koh Khel	Neak Luong	Prek Kdam	Tan Chau	Chau Doc	Average

**Note:** An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

**Performance**

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

	Flood Forecast: time sent			Weather information available (number)	Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)		NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
<b>2015</b>																		
<i>week</i>	10:02	0	-	4	08:15	07:40	07:24	07:08	08:40	08:13	07:04	0	0	2	34	187	5	0
