Weekly Flood Situation Report for the Mekong River Basin
Prepared at: 20/06/2016, covering the week from the 13rd to the 20th June 2016

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of 13rd June to 20th June 2016, three weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather charts of the 13rd June and 19th June are presented in the figures 1 & 2 below:

![Figure 1: Weather map for 13rd June 2016](image1)
![Figure 2: Weather map for 19th June 2016](image2)

South-West (SW) Monsoon

During the last week, the Southwest monsoon prevailed over Andaman Sea, the Gulf of Thailand, Thailand and Indochina Peninsular (Figure 1 and Figure 2).

Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No TD, TS or TY have significantly influenced the LMB during the last week.

Other weather phenomena that affect the discharge

No other weather phenomena affecting the discharge were observed.

Over weather situation

During the last week, the weather is influenced by Southwest monsoon so there were moderate rain and heavy rain in some of areas of Lower Mekong Basin; Especially, mid- last week, the daily data rainfall was observed at Nakhon Phanom 133 mm (17 June), at Thakhek 95.3 mm (17 June); see figure 3 and table A2 for more detail.
Figure 3: Weekly Rainfall Distribution over the LMB from 13th – 20th June, 2016
**General behaviour of the Mekong River**

Compared the Long Term Average (LTA), during the last week, the water levels at most stations of LMB were fluctuated below the LTA. Except at Tan Chau/Chau Doc, the water level was fluctuating about the LTA.

**For stations from Chiang Saen and Luang Prabang**

During the last week, the water levels at these stations were fluctuated below the LTA.

**For stations from Chiang Khan, Vientiane and Nong Khai and Paksane**

During the last week the water levels at these stations were fluctuated below the LTA.

**For stations from Thakhet/Nakhon Phanom to Pakse**

During the last week, the water levels at these stations were below the LTA.

**For stations from Stung Treng to Kampong Cham**

During the last week the water levels at these stations were below the LTA.

**For stations from Phnom Penh to Koh Khel/Neak Luong**

During the last week, the water levels at these stations were below the LTA.

**Tan Chau and Chau Doc**

During the last week, the water levels at both stations were fluctuating about the LTA.

**Note:** For areas between forecast stations, please refer to the nearest forecast station.

**Flood Situation**

- **Flood stage or alarm stage:**
  
  No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

- **Damage or victims:**
  
  No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the last week.

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex B: Accuracy and performance

Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is fairly good for 1-day to 3-day forecast lead time at stations in the upper and middle parts of the LMB. However, the accuracies at upper part stations as Nong Khai, Thakhet, Neak Luong, Koh Khel and two tidal affected stations Tan Chau, Chau Doc for 3, 4-day and 5-day forecast were less than expected.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge. See the Figure B1 and table B1 for more detail.

![Figure B1: Average flood forecast accuracy along the Mekong mainstream (from 13th – 20th June 2016)](image-url)
#### Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

**Note:** An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC ([http://ffw.mrcmekong.org/accuracy.htm](http://ffw.mrcmekong.org/accuracy.htm)).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

**Performance**

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:
Table B3: Overview of performance indicators for the past 5 days including the current report date
