Weekly Flood Situation Report for the Mekong River Basin
Draft by KHEM Sothea
covering the week from 08th to 14th October 2019 and potential trend next week
Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns
During the week from 08th to 14th October 2019, the weather outlook bulletins and maps issued by the Thailand Meteorology Department (TMD) were used to verify the weather condition in the LMB. There were no low pressures went across the LMB, except the low-lying area in Cambodia during this week brought slightly rainfall. Therefore, there were some rainfall in low-lying area and the Mekong Delta, as indicated. They stated that some tropical cyclones sometime develop at the western side of the northern Pacific Ocean and move northwest and pass to the South China Sea. Consequently, LMB will meet below-average rainfall in some areas in October. Figures 1 & 2 presented the weather map for 12th to 14th October 2019.

![Figure 1: Weather map for 12th Oct 2019](image1)

![Figure 2: Weather map for 14th Oct 2019](image2)

Tropical depressions (TD), tropical storms (TS) or typhoons (TY)
No TD, TS or TY was presented in LMB during this week.

Other weather phenomena that affect the discharge
According to the Asian Specialized Meteorological Center (ASMC), climatologically, the prevailing Southwest Monsoon conditions are expected to persist till October 2019. The below-normal rainfall is predicted over the Northeastern parts of Cambodia, Thailand and Viet Nam in September-2019. In terms of temperature, warmer-than-average conditions can be expected over the equatorial ASEAN region and the inland areas of Thailand. Figure 2 showed the rainfall outlook over Southeast Asia in October 2019.
Figure 2: The predicted of below-normal rainfall in October 2019 in Southeast Asia
Figure 3: Weekly Rainfall Distribution over the LMB from 07th to 14th Oct 2019
Over weather situation

The weather of this week was brought moderate rainfall in the LMB. Rainfall in this week was considered below average, covered in the Luang Prabang area, varied from 0.1 mm to 50 mm. The weekly rainfall distribution in the Lower Mekong Basin from 07th to 14th Oct 2019 is showed in Figure 3. The accumulated rainfall in the specific location at Chiang Sean, Luang Prabang, Chiang Khan, Nong Khai, Nakhon Phanom, Pakse, Kratie and Chau Doc up to 15th Oct 2019 are showed in Figure 4. The below- average rainfalls were found from Chiang Sean to Nong Khai, while from Nakhon Phanom and Kratie were considered above average condition, during this week.

It also indicated that last week rainfall over the LMB varied from place to places, which showed the less rainfall in the upper most part (Chiang Sean to Nong Khai), but at Nakhon Phanom and Kratie were showed higher than their LTAs (2015-2018).
Figure 4: Accumulated Rainfall up to 15th October to 2019 in specific stations over the LMB
General behaviour of the Mekong River

This week from 07th to 14th October 2019, water levels from Chiang Sean to Vientiane/Nong Khai were still continuing decreased below their drought year 1992s, varied from 0.01 m to 0.24 m. The water level trend at Luang Prabang is likely affected by the operation from upstream of tributaries (Nam Ben, Nam Ou, Nam Suong and Nam Khan) and downstream at Xayaburi. Water levels at stations at the middle part of LMB from Paksane to Mukdahan have also decreased significantly below their minimum levels. Also followed the trend from upstream, water levels at Khong Chiam, Pakse were also significantly decreased and stay below their minimum levels. Follow the same trend of water levels from upstream, stations at Stung Treng, Kratie, Chaktomuk on the Bassac, Phnom Penh Port and Neak Luong were also below minimum levels. For the 2 tidal stations at Tan Chau and Chau Doc, water levels decreased since early of October 2019, and stayed below their LTAs.

For stations from Chiang Saen and Luang Prabang

Water levels from 07th to 14th October 2019 at Chiang Sean station were slightly decreased and stay below its drought year 1992 and its minimum level, due to the decreased low rainfall and low inflow from Jinghong from 28th Sept which they kept water levels the same track at Jinghong (see its hydrograph in Annex A). At this station water levels decreased from 0.01 m to 0.06 m. At Luang Prabang station, water levels were fluctuated and stay below its LTA. Water levels at this station were increased from 0.08 to 0.60 m due to the low inflow from Chiang Sean and the released from reservoir upstream and downstream at Xayaburi. It was observed that the Luang Prabang stations is likely nominated by hydro power dam operation upstream (tributaries) and downstream (Xayaburi) in which water levels always fluctuated above their LTAs, during the impounding reservoir at Xayaburi from end of October 2018 to May 2019.

For stations from Chiang Khan, Vientiane and Nong Khai and Paksane

Water levels from 07th to 14th October 2019 at these stations were followed the same trend of upstream inflowed at Chiang Sean, which decreased from 0.01 m to 0.28 m. The current observed water levels at Chiang Khan, Vientiane/Nong Khai and Paksane stations are lower than their historical minimum levels and drought year of 1992.

For stations from Nakhon Phanom/Thakhet to Mukdahan/Sovannakhet

Water levels from 07th to 14th October 2019 at Nakhon Phanom/Thakhet to Mukdahan/Sovannakhet stations were significantly decreased due to low inflows from upstream and below average rainfalls from the contribution inflow areas, varied from 0.02 m to 0.15 m. The current water levels at these stations reached below their minimum historical levels and drought years 1992.

For stations from Khong Chiam to Pakse

Water levels from 07th to 14th October 2019 at Khong Chiam to Pakse stations were significantly decreased after flood effected in early this month. The water levels decreased from 0.03 m to 0.37 m. The current water levels at these stations below their minimum historical levels.

For stations from Stung Treng to Kompong Cham/ Phnom Penh to Koh Khel/Neak Luong

Water levels from 07th to 14th October 2019 at Stung Treng, Kratie and Kompong Cham were drastically decreased, varied from 0.03 m to 0.50 m. The current water levels at Stung Treng, Kratie, Kompong Cham and Koh Khel stations were below their historical minimum levels, while at Chaktomuk and Koh Khel on the Bassac, Phnom Penh Port and Prekdam on the Tonle Sap and Neak Luong on the Mekong are below their LTAs levels (1980-2018).

Tan Chau and Chau Doc

Water levels from 07th to 14th October 2019 at the 2 tidal stations at Tan Chau and Chau Doc were dropped below their LTAs.
According to the Japan Meteorological Agency (JMA), Sea surface temperature (SST) variability in the tropics can significantly impact on the global climate through atmospheric circulation. El Niño event, which are identified by SST fluctuations from the central to the eastern equatorial Pacific (NINO.3), are not widely spread as previous months. The NINO3 index is one of several El Niño/Southern Oscillation (ENSO) indicators based on sea surface temperatures.

**Discussion and Conclusion**

From 07th to 14th October 2019, the trend of water levels at Chiang Sean were continued to decrease due to the less outflows from Jinghong and below average rainfall from catchment inflows. Water level at Chiang Sean is relied from inflow from Jinghong Hydropower Station on Lancang and its catchment rainfall. The impact could obviously see the gradually decreasing water level to downstream to Vientiane/Nong Khai. Based on a hydrological phenomenon, the inflow contribution of water from the upstream of Lancang-Mekong in China to the Mekong mainstream is about 16% in total during the Dry season from Nov to May, while 24% in the Wet season (Adamson. 2010). The whole inflow of water into the lower Mekong basin is influenced more by inflow from tributaries and the direct rainfall catchment.

The low inflows from upstream and less rainfall in catchments, resulting water levels from Pakse to Pakse are drastically dropped below their minimum levels.

However, from Stung Treng, Kratie and Kompong Cham stations water levels are followed the same trend from upstream which stay below their minimum levels.

Wet Season 2019 (Sep-Oct) is characterized low rainfall at the upper part.

Due to the low flow of the Mekong, the upcoming **Dry Season** can be possible to face the dangerous shortage of water for drinking and agricultural production, fishery production, ecological systems, biodiversity, bank erosion, salinity intrusion in the Mekong Delta and waterway transport because not enough water for fish spawning and also aquatic lives ect. The reduced water flow could also affect to the expanding unsaturated soil which cause bank erosion and salinity intrusion from the sea.

**Note:** For detail information on the current flows and water levels situation from upstream to downstream, [Annex A](#) presented hydrographs of water level at the 22 key stations on the Mekong River.

**The Trend of water level and its Outlook**

Based on daily river flood forecasting bulletin next week from 15th to 20th October 2019, water levels at Chiang Saen will slight increase that can be varied from 0.02 m to 0.07 m, while the water level of the station at Luang Prabang will be fluctuated due to the impact of the inflow from reservoir operation upstream and downstream. Water levels at Chiang Khan, Vientiane /Nong Khai and Pakse will also slight increase, varied from 0.02 to 0.10 m. From Nakhon Phanom to Sovanakhet, water levels will be decreased from 0.04 m to 0.15 m. The 5 days forecasted rainfall of NOAA (GFAS) of showed below-normal rainfall will continue in the next 5 days in some places mainly in the low-lying area and the Mekong Delta.

From Stung Treng, Kratie and Kompong Cham, water levels for the 5 days forecasting from 15th to 20th October 2019 will decreased from 0.05 m to 0.35 m, while at Chaktomuk, Tole Sap at Phnom Penh Port, Prekdam on the Tonle Sap and Neak Luong on the Mekong will slightly increase due to some rainfall in the low-lying area in the Mekong Delta.

For the tidal stations at Tan Chau and Chau Doc will decreased and stay below their LTAs from 15th to 20th October Oct 2019, varied from 0.03m to 0.20 m.
