## **Key Messages**

Key messages for this weekly report are presented below.

#### Rainfall monitoring and forecast

- In the period of 04 10 June 2024, there has been light to heavy rainfall has been observed over the LMB. The moderate to heavy rainfall has been observed over the LMB in Chiang Saen, Paksane, Vientiane, Thakhek, Paklay, Ban Pak Kanhoung...
- During 11 16 June 2024, the accumulated rainfall over the entire Lower Mekong Basin is distributed with light to moderate rain. However, during 15 - 16 June, moderate rainfall is expected in the central parts of Lao PDR (Vientiane, and Paksane), southwestern & eastern Cambodia, the 3S Basins, and the Mekong Delta.

## Water level monitoring and forecast

- At 22 key monitoring stations along the Mekong mainstream from 04 10 June 2024, water levels are normal, and the flow threshold (PMFM 6C) are under normal conditions. It is also the same condition for Tan Chau and Chau Doc monitoring stations, which are significantly influenced by sea tidal fluctuation.
- In the period of 11 16 June 2024, Water levels are forecasted to be slightly decreasing and stable at upper stretches of LMB including Chiang Saen, Luang Prabang and Chiang Khan. However, water level at other remaining stations will rise. At Tan Chau and Chau Doc stations, the water levels are predicted to be also fluctuated, resulting from the influence of sea tidal patterns. Water levels at most of the stations are expected to be below their long-term averages (LTAs) except for Luang Prabang station.

#### **Drought condition and forecast**

- During 4-10 June 2024, the LMB was normal in most parts of the region during the monitoring week, except western part of Cambodia which was in moderate and severe conditions. Severe drought took place in Sa Kaeo, Battambang, Banteay Meanchey, Pursat, and Kampot. They all were Short-Term Droughts.
- The next three-month forecast of rainfall indicates that north-eastern Cambodia, middle and southern Laos and eastern Thailand are likely receiving below average rainfall in June and July, while Cambodia is forecasted to be the wettest area which is likely receiving above average rainfall in June and July. The forecast also indicates that the LMB might receive less than average rain specifically in the middle and southeastern regions and southern Laos is likely the driest area in the region.

## 1 Introduction

This Weekly Wet Season Situation Report presents a preliminary analysis of the weekly hydrological situation in the Lower Mekong River Basin (LMB) for 04 - 10 June 2024. The trend and outlook for water levels are also presented.

This analysis is based on the daily hydro-meteorological data provided by the Mekong River Commission (MRC) Member Countries – Cambodia, Lao PDR, Thailand, and Viet Nam – and on satellite data. The water level indicated in this report refers to an above zero gauge of each station.

The report covers the following topics that are updated weekly:

- General weather patterns, including rainfall patterns over the LMB.
- Water levels in the LMB, including in the Tonle Sap Lake.
- Flash flood and drought situation in the LMB.
- Weather, water level and flash flood forecast, and
- Possible implications.

Mekong River water levels are updated daily and can be accessed from: <a href="http://ffw.mrcmekong.org/bulletin.php">http://ffw.mrcmekong.org/bulletin.php</a>.

Drought monitoring and forecasting information is available at: <a href="http://droughtforecast.mrcmekong.org">http://droughtforecast.mrcmekong.org</a>

Flash flood information is accessible at: <a href="http://ffw.mrcmekong.org/ffg.php">http://ffw.mrcmekong.org/ffg.php</a>

## 2 General Weather Patterns

During the last week, the Lower Mekong Basin influenced by the low-pressure cell and the moderate southwest monsoon. The light to heavy rainfall has been only observed over this region.

Figure 1 presents mean sea level pressure over the region. It is forecasted that the moderate southwest monsoon and the low-pressure will be influenced to the Lower Mekong Basin from 11 - 16 June. Therefore, in the upcoming seven days, over the Lower Mekong Basin are expected to experience light to moderate rainfall, especially moderate rainfall is expected in the upper and central parts of Lao PDR, the 3S basin of Sesan, Srepok and Sekong, the southwestern part of Cambodia, and the Mekong delta.

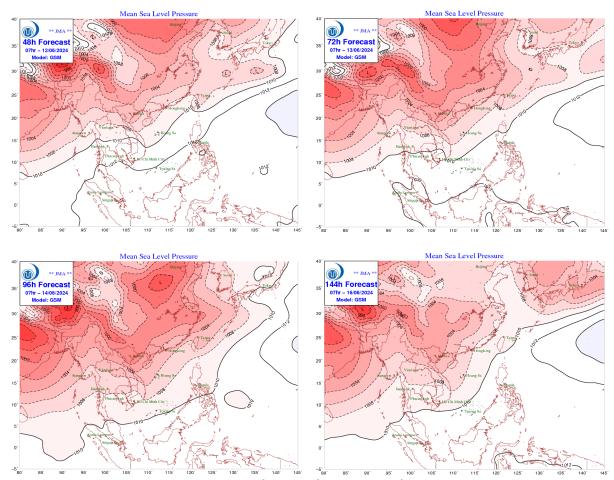

Figure 1: Weather conditions over the LMB

According to the ASEAN Specialised Meteorological Centre (ASMC, <a href="http://asmc.asean.org/home/">http://asmc.asean.org/home/</a>), the subseasonal weather outlook (10 – 23 June 2024) indicates that the western part of Lower Mekong Basin (LMB) is likely in in wetter condition, while drier condition is likely at the Mekong Delta. Moreover, the warmer conditions are predicted to occur almost the entire LMB. **Figure 2** shows the outlook of weather condition from 10 to 23 June 2024 in Southeast Asia based on results from the NCEP model (National Centres for Environmental Prediction).

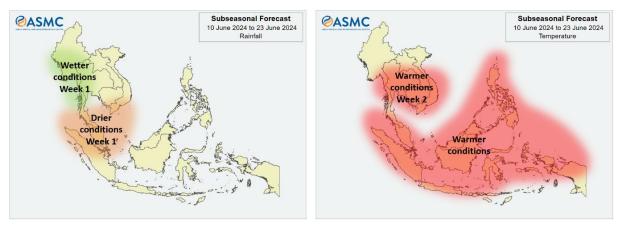

Figure 2: Outlook of wet and dry conditions over the Asian countries by ASMC.

Based on the tropical storm risk (TS) (<a href="https://www.tropicalstormrisk.com/">https://www.tropicalstormrisk.com/</a>), there is no active NW pacific system as of 10 June 2024 as displayed in **Figure 3**.

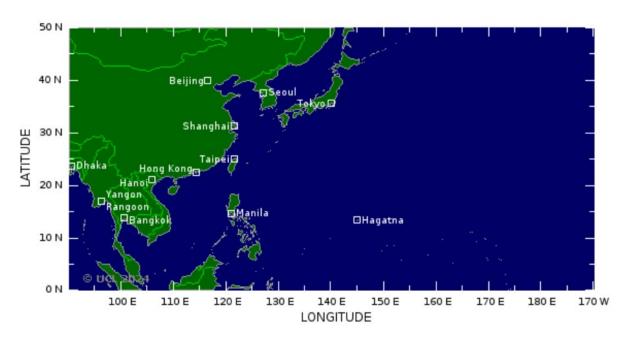

Figure 3: One tropical storm risk observed on 10 June 2024

## 3. Rainfall and Water Level Monitoring

## 3.1. Rainfall monitoring

The weekly accumulated rainfall based on the observed data provided by the MRC Member Countries – Cambodia, Lao PDR, Thailand, and Viet Nam – from 04 - 10 June 2024 (**Figure 4**). The light to heavy rainfall has been only observed over the LMB. However, heavy rainfall can be mostly observed in Lao PDR and 3S basins.

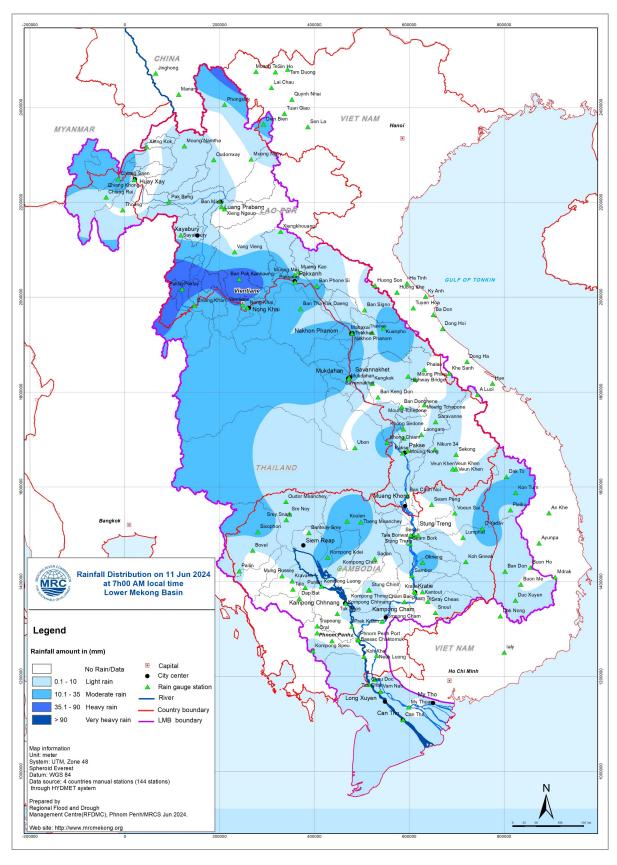

Figure 4: Weekly rainfall distribution over the LMB during 04 – 10 June 2024

## 3.2. Water level monitoring

The hydrological regimes of the Mekong mainstream are illustrated by recorded water levels and flows at key mainstream stations: at Chiang Saen to capture mainstream flows entering from the Upper Mekong Basin (UMB); at Vientiane to present flows generated by climate conditions in the upper part of the LMB; at Pakse to investigate flows influenced by inflows from the larger Mekong tributaries; at Kratie in Cambodia to capture overall flows of the Mekong Basin; and at Viet Nam's Tan Chau and Chau Doc to monitor flows to the Delta.

The key stations along the LMB and their respective model application for River Flood Forecasting during the wet season from June to October and River Monitoring during the dry season from November to May are presented in **Figure 5**. The hydrograph for each key station is available from the MRC's River Flood Forecasting: <a href="http://ffw.mrcmekong.org/overview.php">http://ffw.mrcmekong.org/overview.php</a>.

During 04 – 10 June 2024, the observed water level (WL) at Jinghong hydrological station<sup>1</sup>, was almost constant and ranges between 535.25 m and 535.49 m, which are corresponding to the outflow between 841.00 m³/s to 999.00 m³/s (recorded on 7:00 am), respectively (**Figure 6**). The water level in Chiang Saen station also indicated a slight fluctuation ranging from 1.89 m to 3.24 m. At the same period, the water level in Luang Prabang station also slightly increased with an approximate value of 0.45 m from 9.08 m to 9.53 m as compared to the previous week.

During the same period, the water levels observed at upper parts of the basin at Chiang Khan, Vientiane, Nongkhai, Nakhon Phanom, Thakhek, Mukdahan, Savannakhet, Paksane, Khong Chiam, Pakse, Stung Treng and Kratie have been slightly increasing from 4.10 m to 5.94 m, 2.21 m to 2.66 m, 1.76 m to 2.08 m, 2.90 m to 3.29 m, 2.52 m to 2.81 m, 3.74 m to 4.02 m, 2.85 m to 2.93 m, 1.28 m to 1.37 m, 3.33 m to 3.42 m, 2.22 m to 2.28 m, 3.26 m to 3.49 mand 8.41 m to 8.95 m, respectively.

Moving down to the floodplain area at Kampong Cham, Phnom Penh (Bassac), Phnom Penh Port, and Prek Kdam the water levels have been increased from 3.22 m to 3.53 m, 1.79 m to 2.18 m, 0.80 m to 1.13 m, and 2.10 m to 2.42 m, respectively from previous week. However, at Neak Luong, the water level has slightly decreased from 1.72 m to 1.44 m.

Similar to the previous week, the water levels from 04 to 10 June 2024 at Viet Nam's Tan Chau and Chau Doc fluctuated between their LTA values due to daily tidal effects from the sea. At the Tan Chau station, the water levels varied between 1.09 m and -0.39 m, while at the Chau Doc station, they ranged from 1.27 m to -0.34 m.

<sup>&</sup>lt;sup>1</sup> Near-real time data of hydro-meteorological monitoring at the Jinghong hydrological station is available at <a href="https://portal.mrcmekong.org/monitoring/river-monitoring-telemetry">https://portal.mrcmekong.org/monitoring/river-monitoring-telemetry</a>.

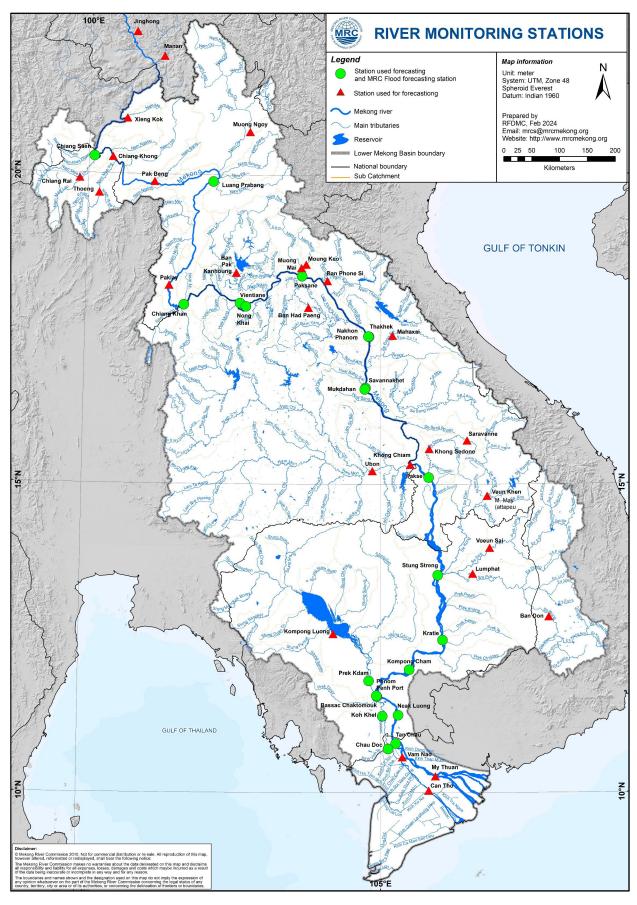

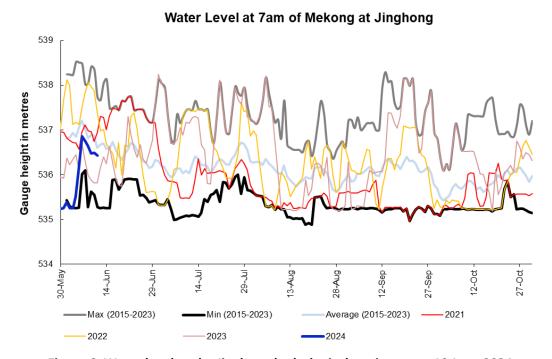

Figure 5: The key stations along LMB for river flood forecasting

The water levels in key monitoring stations on 10 June 2024 are below their long-term averages (LTAs) except for the Luang Prabang station. Moreover, all stations with available PMFM thresholds are in normal conditions. The graphics of water level monitoring in all key stations are presented in **Annex A** and the weekly water levels and rainfall at each key station are summarised in **Annex B**.

## Figure 6. Water level at the Jinghong hydrological station up to 10 June 2024.

At the end of the wet season, when water levels along the Mekong River subside, the outflow of the Tonle Sap Lake (TSL) returns to the Mekong River and then to the Delta. This phenomenon normally takes place between September and October. Based on flow observation at Prek Kdam monitoring station, the outflow of the Tonle Sap Lake took place since 28 September 2023.

The outflow flow is calculated based on a formula of rating-curves using by difference of water levels at Kompong Luong and Phnom Penh Port stations for slop and Prek Kdam as cross-section of the Lake. The formula of flow is as follows:

$$Flow = WL_{Prek\ Kdam}^{1.2} \times \sqrt{|WL_{Phnom\ Penh\ Port} - WL_{Kampong\ Luong}|}$$

Where, WL is water level in m (msl).

The seasonal changes of the inflow/reverse flow and the outflow of the TSL at Prek Kdam in comparison with the flows of 2020, 2021 and 2022, 2023 and their LTA level (1997-2023) are illustrated in **Figure 8**. Up to 10 June 2024, it was observed that the main outflow to Tonle Sap Lake decreased due to no rainfall and less inflows from upstream **(Figure 8)**. This decreased outflow of Tonle Sap Lake was most likely caused by low inflows from its tributaries.

The seasonal changes in monthly flow volumes up to 10 June 2024 for the TSL compared with that in 2020, 2021, 2022, 2023 and their LTAs, and the fluctuation levels (1997–2023) are presented in **Table 8**. The mean monthly water volume of the Tonle Sap Lake in May 2024 is lower than its LTA (about 87.34 %), 2023 and 2022 but higher than that in 2019, 2020, and 2021 during the same period **(Figure 8 and Table 1)**.

## 4. Flash Flood in the Lower Mekong Basin

During the weekly monitoring period from 04 - 10 June, the LMB received light to heavy rain and thunderstorms in some areas.

According to the Southeast Asian Flash Flood Guidance System (SEAFFGS) and analysis, flash flood guidance was detected at low level in the next 1, 3 and 6 hours in some areas of Lao PDR, Cambodia, and Viet Nam during the reporting period as shown in Figure 14 and Table 2.

Table 2. Detected low-risk flash flood in the LMB on 09 - 10 June

## 5. Drought Monitoring in the Lower Mekong Basin

## 5.2. Weekly drought monitoring from 4 to 10 June 2024

Drought monitoring data for 2024 are available from Monday to Sunday every week; thus, the reporting period is normally delayed by one day compared to Flood and Flash Flood reports. We adopt the Index of Soil Water Fraction (ISWF) data obtained from FFGS to represent soil moisture of agricultural indicator for both dry and wet seasons.

## • Weekly Standardised Precipitation Index (SPI1)

Meteorological indicator shows that from 4 to 10 June 2024, as shown in Figure 9, the LMB was facing some meteorological drought over the central and lower parts. Severe meteorological drought was taking place in Battambang, Pailin, Banteay Meanchey, Kampong Chhnang, Kampong Speu, Kampot, Takeo, Kandal, Prey Veng, Savannakhet, Salavan, Xekong, Attapu, Xayaburi, Loei, Chaiyaphum, Khon Kaen, Nakhon Ratchasima, Gia Lai, Can Tho, An Giang, and Ca Mau.

.

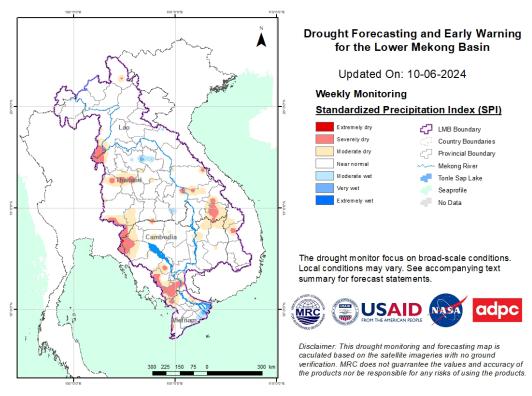

Figure 10: Weekly standardized precipitation index from June 4 to 10.

#### Weekly Index of Soil Water Fraction (ISWF)

Some severe agricultural droughts, as displayed in **Figure 10**, were taking place in Battambang, Pursat, Gia Lai and Dak Lak during the monitoring week from June 4 to 10. Other places were normal.

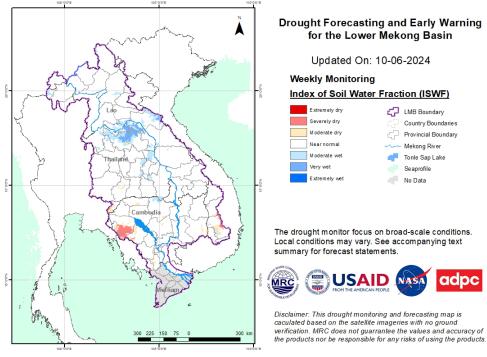

Figure 11: Weekly Index of Soil Water Fraction from June 4 to 10.

#### Weekly Combined Drought Index (CDI)

The combined drought indicator, **Figure 11**, shows that the LMB was normal in most parts of the region during the monitoring week, except western part of Cambodia which was in moderate and severe conditions. Severe drought took place in Sa Kaeo, Battambang, Banteay Meanchey, Pursat, and Kampot. They all were Short-Term Droughts.

The impacted areas are listed below:

Number	Country	Province	Mderate	Severe	Extreme	xceptiona	Number	Country	Province	Mderate	Severe	Extreme	xceptiona	Number	Country	Province	Mderate	Severe	Extreme	xceptiona
		Battamabang					24	Lao PDR	Oudomxai					47	Thailand	Udon Thani

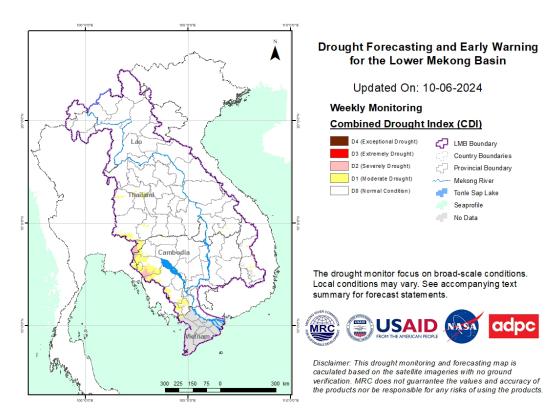

Figure 12: Weekly Combined Drought Index from June 4 to 10.

More information on Drought Forecasting and Early Warning (DFEW) as well as the explanation is available here: <a href="http://droughtforecast.mrcmekong.org/templates/view/our-product">http://droughtforecast.mrcmekong.org/templates/view/our-product</a>. DFEW provides not only weekly monitoring and forecasting information but also a three-month forecast of drought indicators with seasonal outlook which are updated every

month based on international weather forecast models. Details on drought forecast are described in section <u>6.4</u> of this report.

## **6** Weather and Water Level Forecast and Flash Flood information

## **6.1** Rainfall forecast

During 11-16 June 2024, the accumulated rainfall over the entire Lower Mekong Basin is distributed with light to moderate rain based on CHIRPS-GFS (**Figure 12**). The moderate rainfall will be expected to occur in the upper and centre part of Lao PDR, the 3S Basins, and the western part of Cambodia.

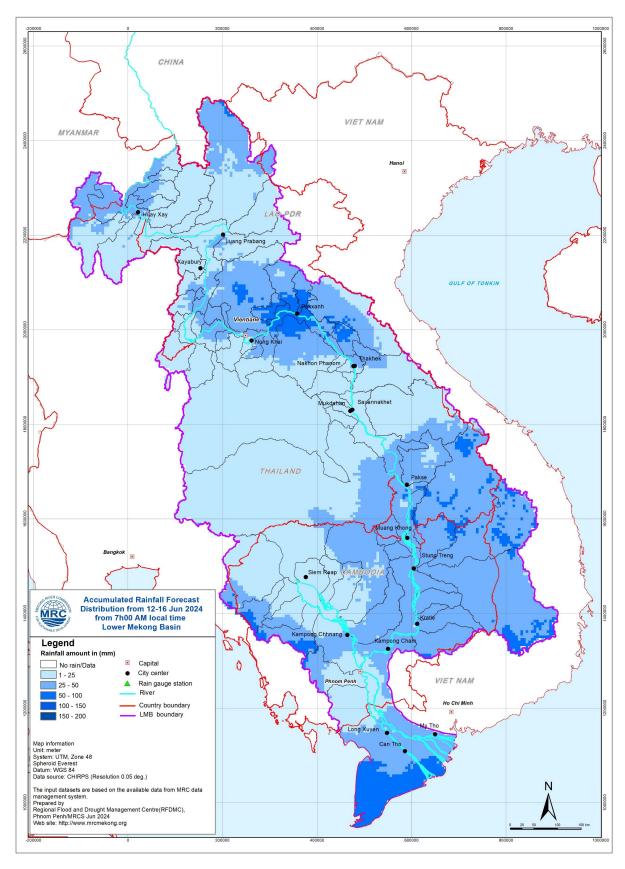

Figure 13: Accumulated rainfall forecast from CHIRP-GFS (11 – 16 June 2024)

#### **6.2** Water level forecast

In Chiang Saen monitoring station, the water level is expected to be fluctuated over the forecasting period of 11-16 June 2024. However, it will slightly decrease from 3.24 m to 2.85 m. The water levels in Luang Prabang affected by backwater and Chiang Khan stations are likely stable.

Along the Mekong mainstream, the water levels at all stations will slightly increase. At Vientiane, Nongkhai, Paksane, Nakhon Phanom, Thakhek, Mukdahan, Savannakhet, Kong Chiam, Pakse, Stung Treng, Kratie, Kampong Cham, Phnom Penh Bassac, Phnom Penh Port, Koh Khel, Neak Luong, and Prek Kdam, water levels will slightly rise of approximately 0.39 m, 0.86 m, 0.46 m, 0.25 m, 0.46 m, 0.42 m, 0.45 m, 0.30 m, 0.29 m, 0.20 m, 0.40 m, 0.40 m, 0.18 m, 0.15 m, 0.31 m, 0.19 m, 1.04 m, and 0.96 m respectively. However, water level at Koh Khel is expected to drop of approximately -0.16 m in the next 5 days.

For the Tan Chau station on the Mekong River and Chau Doc station on the Bassac River, water levels will be fluctuating approximately ranging from -0.39 to 0.65 m and -0.34 to 0.62 m, respectively, following daily tidal effects from the sea.

The water levels at key stations are forecasted to be below their LTAs except for Luang Prabang station from 04 to 10 June 2024.

The weekly River Monitoring Bulletin and forecasting issued on 10 June 2024 can be found in **Table 2.** Results of the weekly river monitoring and forecasting bulletin are also available at <a href="http://ffw.mrcmekong.org/bulletin.php">http://ffw.mrcmekong.org/bulletin.php</a>

Table 3. River Monitoring and Forecasting Bulletin.

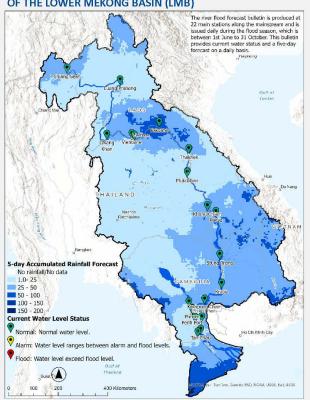

## **MEKONG RIVER MONITORING AND FORECASTING BULLETIN**

#### Monitoring on 11 June 2024

**Highlights:** Today's water levels in all mainstream stations are "normal", and the flow thresholds (PMFM 6C) are under "normal conditions.

# THE FORECASTING HYDROLOGICAL STATION MAP OF THE LOWER MEKONG BASIN (LMB)

**Remarks:** The river flood forecast bulletin is produced at 22 main stations along the mainstream and is issued daily during the flood season, which runs from  $1^{\pm}$  June to  $31^{\pm}$  October. This bulletin provides information on the current water level status and a five-day forecast on a daily basis.

#### WATER LEVEL STATUS DEFINITIONS

Norma	Normal water level.
Alarm	Alarm when the water level ranges between alarm and flood levels.
Flood	Flood is when the flood level exceeds. A flood level is determined by member countries.

MRC Secretariat, Vientiane, Lao PDR | E: mrcs@mrcmekong.org | T: +856 21 263 263 MRC Regional Flood and Drought Management Centre, Phnom Penh, Cambodia |

#### WATER LEVEL FORECASTING DEFINITIONS

1	Rising water level.
$\rightarrow$	Stable water level: stable water level is defined as a daily change of less than 10cm from Chaing Saen to Savannakhet; less than 5cm at Pakse and Stung Treng; and no more than 3cm from Kratie downstream.
$\downarrow$	Falling water level.
Х	No data available.
Alarm stage	Alarm stage is when the water level ranges between alarm and flood levels.
Flood stage	Flood stage is when the flood level exceeds. A flood level is determined by member countries.

#### NOTES

- During 15-16 June, moderate rainfall is expected to occur in the central parts of Lao PDR (Vientiane & Paksane), southwestern & eastern Cambodia, the 3S Basins and the Mekong Delta.
- Water levels at most of stations are forecasted to be slightly
  increasing from 12 to 16 June except for the upper parts at Chiang
  Saen, Luang Prabang, Chiang Khan stations and lower part at Koh
  Khel station. The water levels at Tan Chau and Chau Doc are
  forecasted to be fluctuated due to sea tidal influence.
- Water levels at all stations are expected to be below their longterm averages (LTAs) except for Luang Prabang station from 12 to 16 June.

This information is supplied as a service to the governments of the MRC Member Countries so that it may be used as a tool within existing national disaster forecast and warning systems.

#### **6.3** Flash Flood Information

With the predicted of rainfall for the coming week, flash floods might be detected in some areas in the LMB. And local heavy rain in a short period of time is possible with unpredictable short flash floods.

Further detailed information on Flash Flood Guidance Information, as well as on its explanation, is available for download <a href="https://example.com/here/beaches/">here</a>.

## 6.4 Drought forecast

There are several climate-prediction models with different scenarios in the upcoming months. The MRC's DFEWS adopts the global scale of North America Multi-Model Ensemble (NMME) that predicts average rainfall in daily average for the next coming three months.

**Figure 13** below shows the average daily rainfall forecast from June to August 2024 over the LMB area.

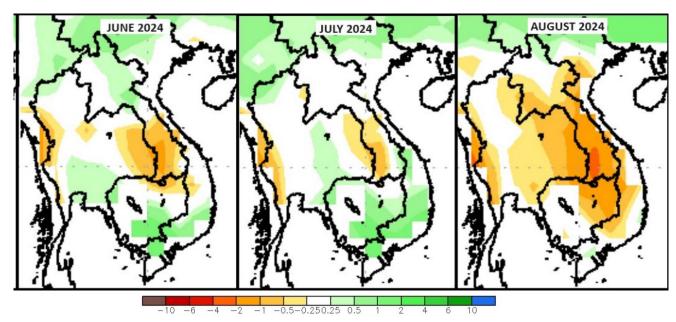

Figure 14. Monthly forecast of rainfall from NMME for June, July, and August 2024.

**Figure 13** indicates that North-eastern Cambodia, middle and southern Laos and eastern Thailand are likely receiving below average rainfall in June and July, while Cambodia is forecasted to be the wettest area which is likely receiving above average rainfall in June and July. The forecast also indicates that the LMB might receive less than average rain specifically in the middle and south-eastern regions and southern Laos is likely the driest area in the region.

## 7 Summary and Possible Implications

#### 7.1. Rainfall and its forecast

In the period of 04 - 10 June 2024, there has been light to heavy rainfall has been observed over the LMB. The moderate to heavy rainfall has been observed over the LMB in Chiang Saen, Paksane, Vientiane, Thakhek, Paklay, Ban Pak Kanhoung...

During 11 – 16 June 2024, the accumulated rainfall over the entire Lower Mekong Basin is distributed with light to moderate rain. However, during 15 - 16 June, moderate rainfall is expected in the central parts of Lao PDR (Vientiane, and Paksane), southwestern & eastern Cambodia, the 3S Basins, and the Mekong Delta.

#### 7.2. Water level and its forecast

At 22 key monitoring stations along the Mekong mainstream from 04 - 10 June 2024, water levels are normal, and the flow threshold (PMFM 6C) are under normal conditions. It is also the same condition for Tan Chau and Chau Doc monitoring stations, which are significantly influenced by sea tidal fluctuation.

In the period of 11 - 16 June 2024, Water levels are forecasted to be slightly decreasing and stable at upper stretches of LMB including Chiang Saen, Luang Prabang and Chiang Khan. However, water level at other remaining stations will rise. At Tan Chau and Chau Doc stations, the water levels are predicted to be also fluctuated, resulting from the influence of sea tidal patterns. Water levels at most of the stations are expected to be below their long-term averages (LTAs) except for Luang Prabang station.

#### 7.3. Flash flood and its trends

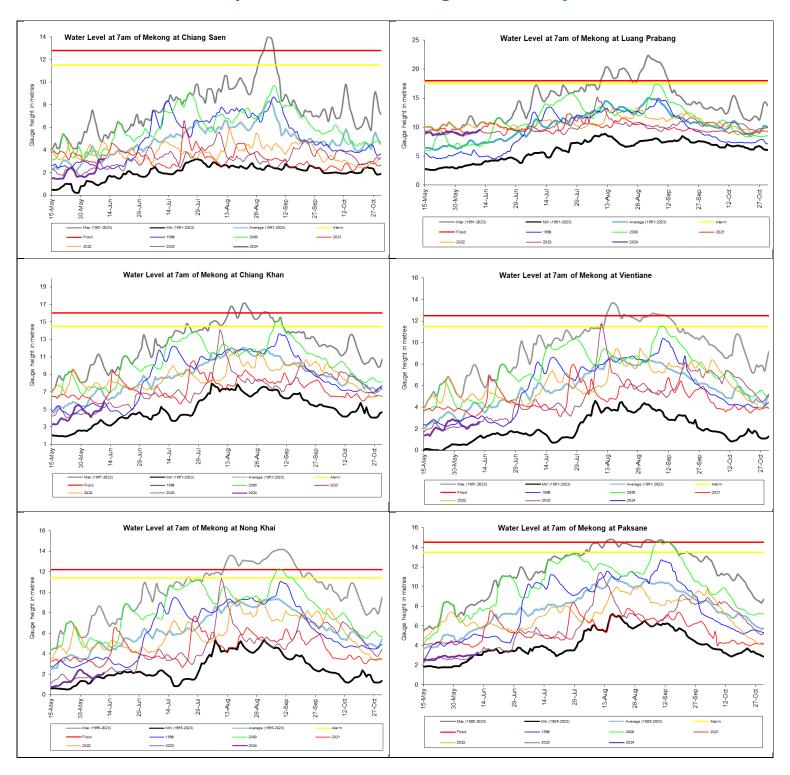

With the predicted of rainfall for the coming week as mentioned earlier in part 2, the flash flood guidance at a low level will likely be detected in some areas of the LMB.

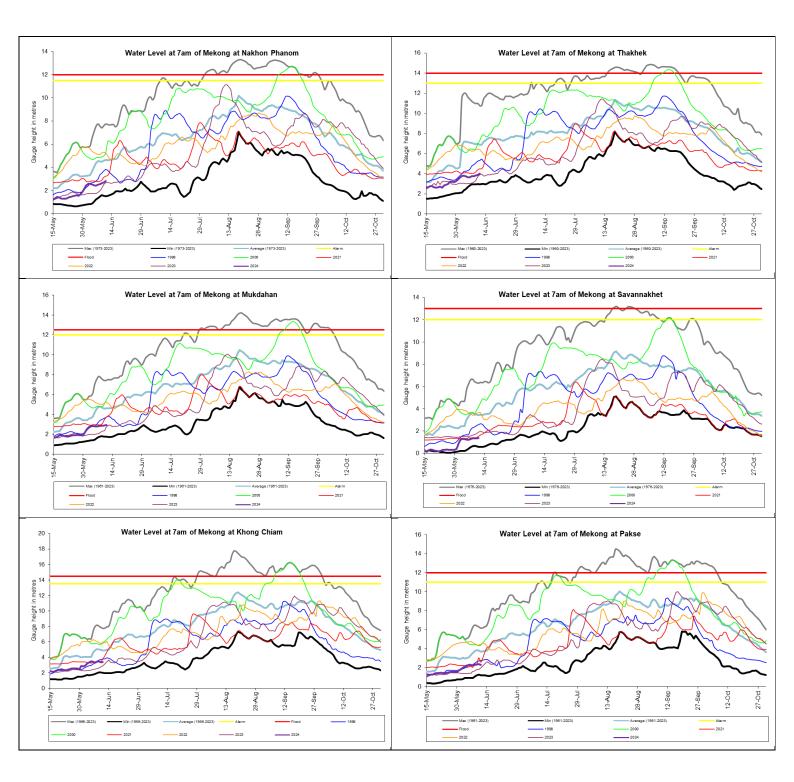

## 7.4. Drought condition and its forecast

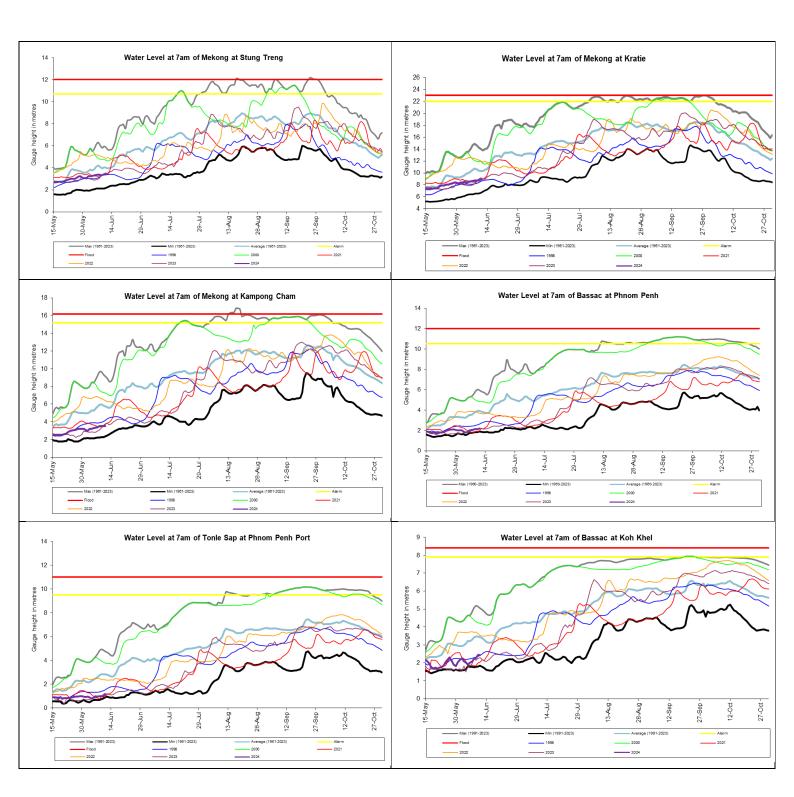

During 4-10 June 2024, the LMB was normal in most parts of the region during the monitoring week, except western part of Cambodia which was in moderate and severe conditions. Severe drought took place in Sa Kaeo, Battambang, Banteay Meanchey, Pursat, and Kampot. They all were Short-Term Droughts.

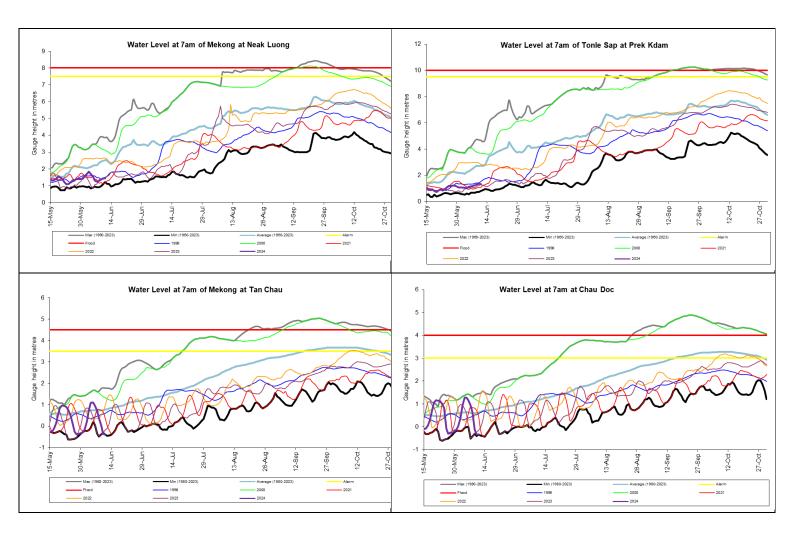

The next three-month forecast of rainfall indicates that north-eastern Cambodia, middle and southern Laos and eastern Thailand are likely receiving below average rainfall in June and July, while Cambodia is forecasted to be the wettest area which is likely receiving above average rainfall in June and July. The forecast also indicates that the LMB might receive less than average rain specifically in the middle and south-eastern regions and southern Laos is likely the driest area in the region.

## Annex C: Performance of the weekly flood forecasting

"Accuracy" here refers to the state where data recorded in the MRC's Mekong River Flood Forecasting System are cleaned and verified.

The adjustment of flood forecasting outcomes from the flood forecasting system requires flood forecasters to have extensive knowledge in hydrology and statistical modelling for estimating the relationships between stations upstream and downstream in the Mekong River Basin. Flood forecasting performance presented in the graph below shows the average flood forecasting accuracy at each key station along the Mekong mainstream from 04 to 10 June 2024.

The forecasting values from 04 to 10 June 2024 show that the overall accuracy is fair for a four-day to five-day forecast in lead time (less than 250 cm) for all of the stations from the upper to the lower parts of the Mekong River with combine information of rainfall and reservoirs' operation in this area during the report period.

<u>Note:</u> The higher percentage of flood forecasting accuracy is due to several key factors as follows:

- Missing rainfall in Cambodia (DOM) data and data input are not sufficient to be used for inputting into the flood forecasting model system.
- Chiang Saen station is influencing by hydropower upstream operation from China.
- Luang Prabang to Chiang Khan and Paksane to Stung Treng to Kratie have been influenced by hydropower operations upstream, tributaries inflows.
- The influence of heavy rainfall caused by storms and hydropower operations from upstream, tributaries inflows and the lower part of the Mekong floodplain, including the 3S (Stung Treng and Kratie).
- Fluctuations of the water levels at Tan Chau and Chau Doc stations were due to daily tidal effects of the sea in the Mekong Delta.
- Satellite rainfall data were not representative of the actual rainfall at ground stations in some areas of the Mekong region.
