

Weekly Flood Situation Report for the Mekong River Basin

Prepared on: 22/10/2012, covering the week from the 15th October to the 21st October, 2012

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of 15th October to the 21st October 2012, three weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather charts of the 15th October and the 20th October bulletins are presented in the figures below:

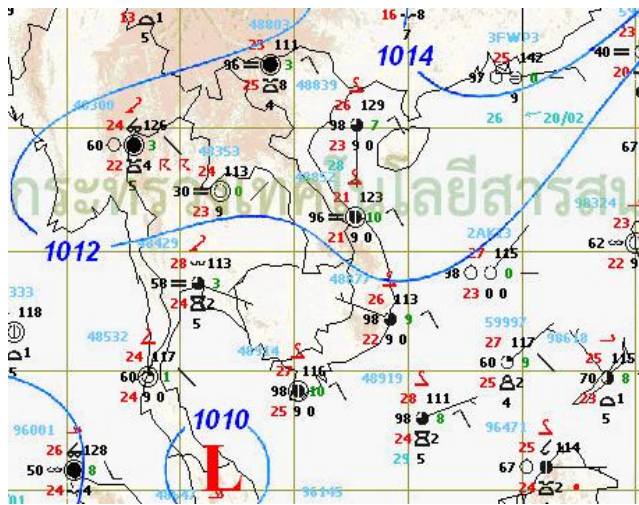

Figure 1: Weather map for 15th October 2012

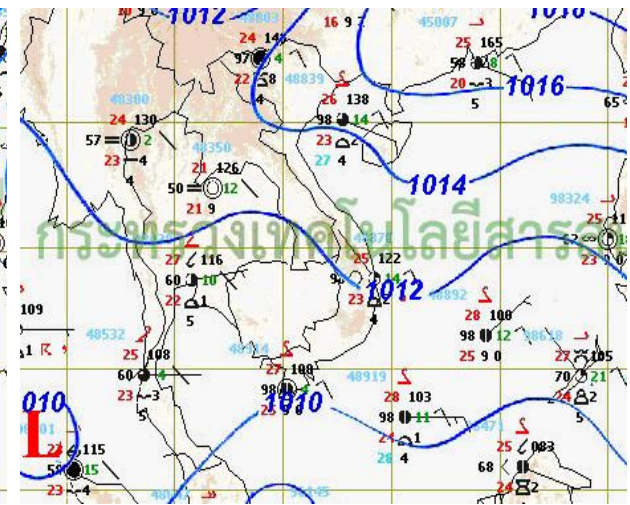

Figure 2: Weather map for 20th October 2012

South-West (SW) Monsoon

Moderate SW monsoon prevailed over Amندا Sea and the Gulf of Thailand during last week (Figure 1 and 2).

Inter Tropical Convergence Zone (ITCZ)

No Inter Tropical Convergence Zone (ITCZ) was observed during the reporting period (Figure 1 and 2).

Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No Tropical depression (TD) or Tropical Storm have significant affected to the LMB in last week.

Other weather phenomena that affect the discharge

No other weather phenomena affecting the discharge were observed.

Overall weather situation

A normal weather situation lasted during the reporting period. As a result of SW monsoon activity and the ridge of high pressure across Myanmar, Thailand, Lao PDR, Cambodia, Viet Nam, heavy rain occurred in the East and the South of Thailand; in the West, the Northwest and the South of Cambodia; the South of Viet Nam during last week. Figure 3 illustrates the amount of rainfall covering the LMB from 15 to 22 October.

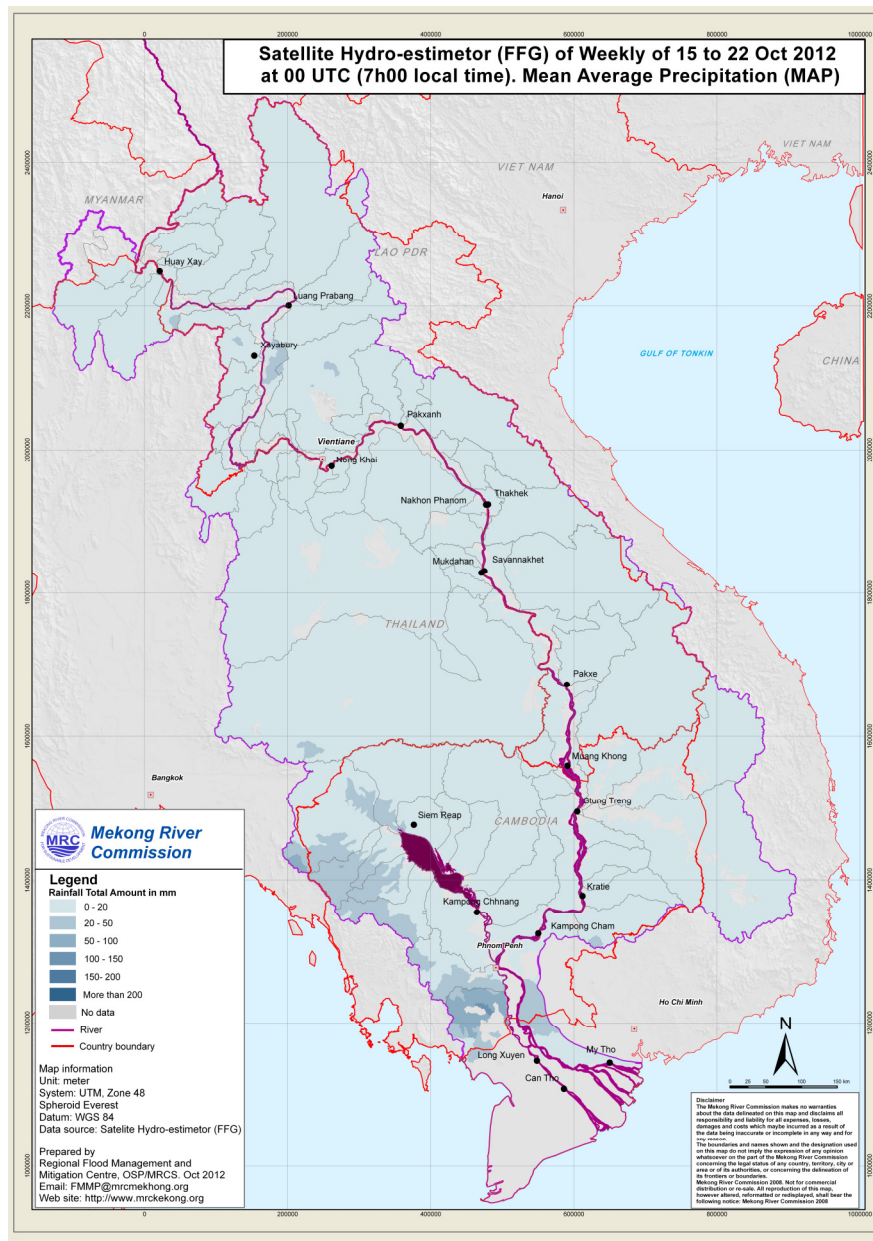

Figure 3 : Rainfall distribution over the LMB, from the 15th October to 21st October 2012

General behaviour of the Mekong River

Water levels of all stations in LMB were below the long-term average for this time of the year during the monitoring period. Water levels at stations in the upper reach were more-or-less stable while water levels at stations in the middle and lower reaches showed a slightly decreasing trend in last week.

Regarding to 2 stations in downstream at Tan Chau and Chau Doc, water levels at those 2 stations were falling during last week and far below the long-term average for this time of the year.

For stations from Chiang Saen to Paksane

Water level was more-or-less stable during monitoring period. These stations were recording levels that were below the long-term average for this time of the year.

For stations from Nakon Phanom/ Thakhek to Pakse

Water levels at stations from Nakon Phanom/ Thakhek to Pakse showed a falling trend during the monitoring period. These stations were recording levels that are below the long-term average for this time of the year.

For stations from Stung Treng to Kompong Cham

Water levels at stations from Strung Treng to Kompong Cham were decreasing during last week and below the long-term average for this time of the year.

For stations from Phnom Penh to Koh Khel. Neak Luong

Water levels at these stations were slightly decreasing during last week and below the long-term average for this time of the year.

Tan Chau and Chau Doc

Water levels were recessing in last week. Both stations were recording levels that were far below the long-term average for this time of the year and significantly affected by tidal effects.

Note: for areas between forecast stations, please refer to the nearest forecast station.

Flood Situation

- Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the past week. Water levels are still significantly below flood levels (as defined by the national agency) at all forecast stations.

- Damage or victims:

No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the past week.

For more details see the following annex:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex A: Graphs and Tables

Annex B: Accuracy and performance

Accuracy

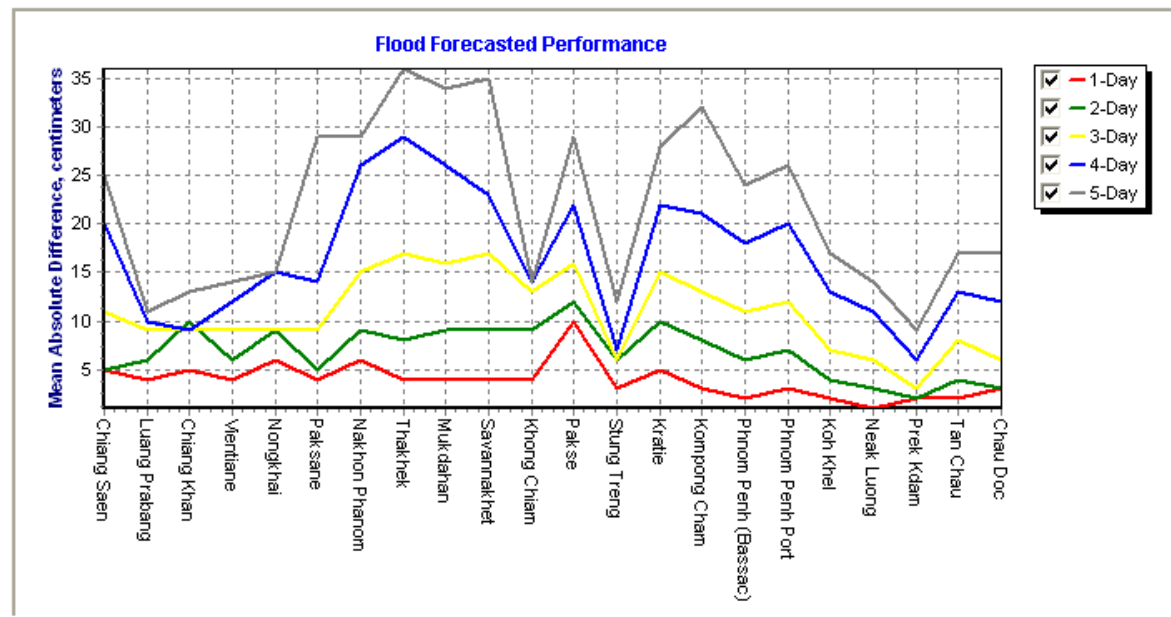

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

The graph of average difference between forecast and actual water levels for the past week shows an abnormal pattern in which accuracies at stations in the upper reach are better than that at stations in the middle part of the LMB.

In general, accuracies at most stations along mainstream of Mekong River in the LMB for all forecast lead time are fairly good. However, accuracies at Tan Chau and Chau Doc for 4-day forecast lead time were less than expected.

The above differences perhaps caused by internal model functionality in forecasting at those stations; for which the parameter adjustment in the model is not possible.

Figure B1: Average flood forecast accuracy along the Mekong mainstream

Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

unit in %

Note: An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

	Flood Forecast: time sent				Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)	Weather information available (number)	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
2012																		
<i>week</i>	10:28	0	-	3	08:12	08:12	06:58	06:10	08:53	07:05	07:09	0	0	0	242	144	12	149
