

Weekly Flood Situation Report for the Mekong River Basin

Prepared at: 14/07/2014, covering the week from the 07th July to the 14th July 2014

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of 07th July to 14th July 2014 four weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps of the 08th July and 12nd July 2014 are presented in the Figures 1 and 2 below:

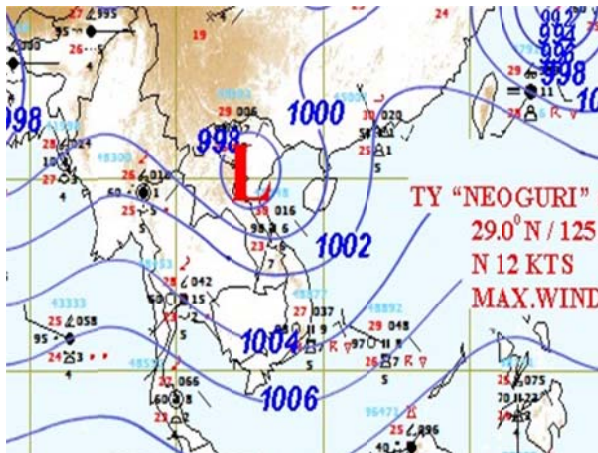

Figure 1: Weather map for 08th July 2014

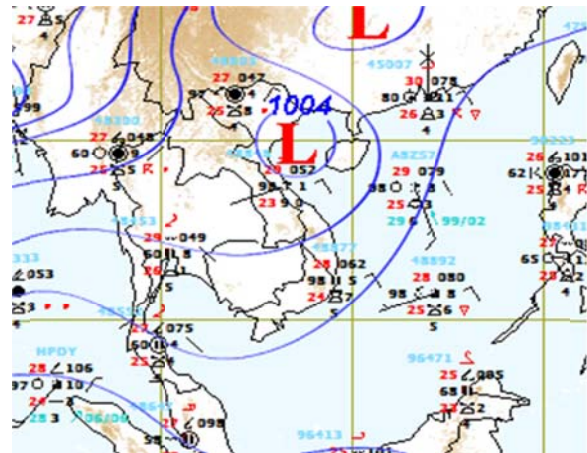

Figure 2: Weather map for 12th July 2014

Moderate South-West (SW) Monsoon

The strong Southwest monsoon prevails over Myanmar, the Andaman Sea and the Gulf of Thailand at the surface (Figure 1 and 2).

Inter Tropical Convergence Zone (ITCZ)

No ITCZ was observed during last week.

Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No TD, TS or TY have significant influenced the LMB during the last week.

Other weather phenomena that affect the discharge

The trough of low pressure lies across Thailand, Cambodia, Lao PDR and Viet Nam at the height of 1.5km during last week.

Over weather situation

The weather of the last week was influenced by Southwest monsoon and trough of low pressure that laid across Thailand, Cambodia, Lao PDR and Viet Nam. Therefore, isolated heavy rainfalls had happened in many areas in the upper and middle reaches of LMB. The accumulative weekly rainfall greater than 100 mm. are at Chiang Saen (247.1 mm.), Vientiane (227.3 mm.), Nongkhai (145.9 mm.), Paksane (168 mm.), Nakhon Phanom (145.9 mm.), Thakhek (190.1 mm.), Mukdahan (136.6 mm.), Savannakhet (160.1 mm.), Khong Chiam (106.4 mm.), Pakse (111.6 mm.), Stung Treng (218 mm.) and Kratie (111.8 mm.). See Table A2 and Figure 3.

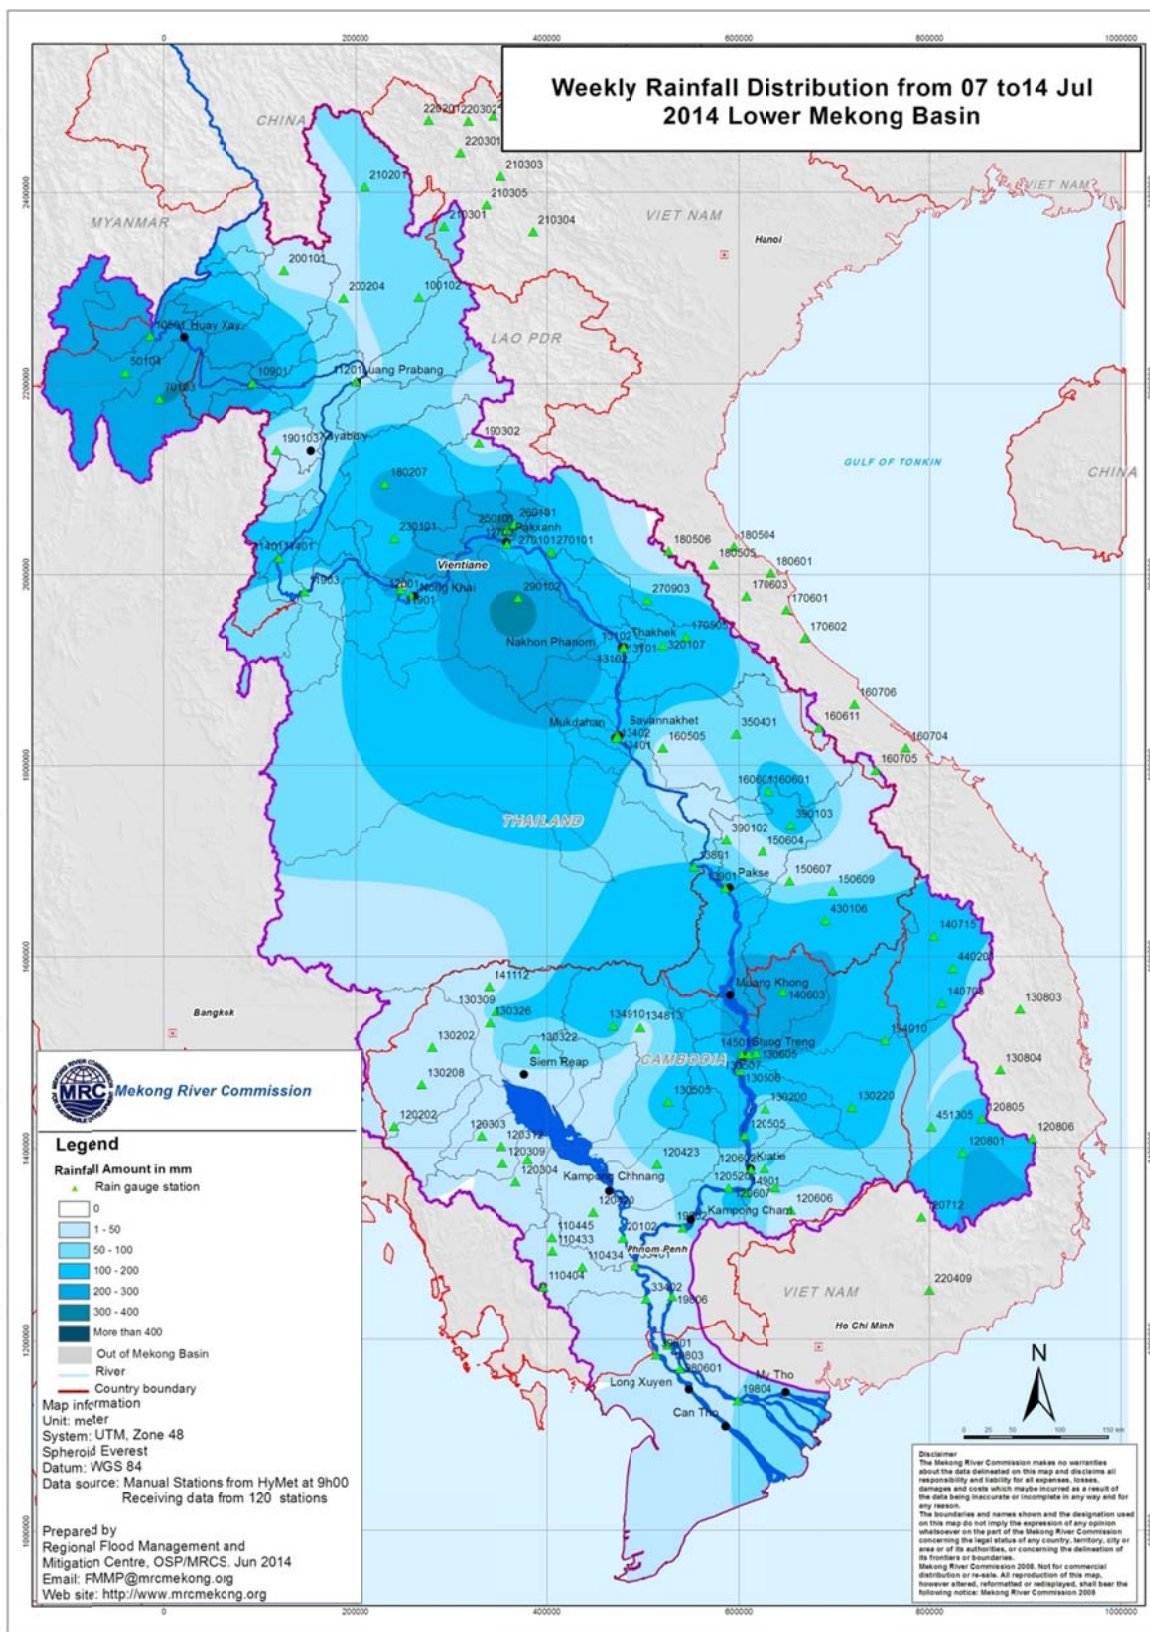

Figure 3: Weekly Rainfall Distribution from 07th – 14th July 2014 over the LMB

General behaviour of the Mekong River

During the last week, the water levels at most stations in LMB were rising below the Long Term Average (LTA) start from Chiang Saen to Pakse and above LTA from Strung Treng to Prek Kdam. For Tan Chau and Chau Doc, water levels were fluctuating below and above the LTA, respectively.

For stations from Chiang Saen and Luang Prabang

Compared to the long term average (LTA), the water levels at these stations were rising below the LTA.

For stations from Chiang Khan, Vientiane and Nong Khai and Paksane

Compared to the long term average (LTA), the water levels at these stations were rising below the LTA.

For stations from Thakhet/Nakon Phanom to Pakse

Compared to the long term average (LTA), the water levels at these stations were rising below the LTA.

For stations from Stung Treng to Kompong Cham

Compared to the long term average (LTA), the water levels at these stations were rising above the LTA.

For stations from Phnom Penh to Koh Khel/Neak Luong

Compared to the long term average (LTA), the water levels at these stations were rising above the LTA.

Tan Chau and Chau Doc

Compared to the long term average (LTA), the water levels at both stations fluctuated below and above the LTA, respectively.

Note: For areas between forecast stations, please refer to the nearest forecast station.

Flood Situation

▪ Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

▪ Damage or victims:

No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the last week.

For more details see the following annex:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex A: Graphs and Tables

Annex B: Accuracy and performance

Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is fairly good for 1-day to 2-day forecast lead time at stations

in the upper and lower parts of the LMB. However, the accuracies at Luang Prabang, Strung Treng, Kratie, Tan Chau and Chau Doc for 3-day to 5-day forecast were less than expected.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge.

Figure B1: Average flood forecast accuracy along the Mekong mainstream

Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

	Chiang Saen	Luang Prabang	Chiang Khan	Vientiane	Nongkhai	Paksane	Nakhon Phanom	Thakhek	Mukdahan	Savannakhet	Khong Chiam	Pakse	Stung Treng	Kratie	Kompong Cham	Phnom Penh (Bassac)	Phnom Penh Port	Koh Kheh	Neak Luong	Prek Kdam	Tan Chau	Chau Doc	Average

Unit in cm

Note: An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

	Flood Forecast: time sent			Weather information available (number)	Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)		NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
