

### Weekly Flood Situation Report for the Mekong River Basin

Prepared at: 12/10/2015, covering the week from the 05<sup>th</sup> to 12<sup>th</sup> October 2015

### Weather Patterns, General Behaviour of the Mekong River and Flood Situation

#### General weather patterns

During the week of 05<sup>th</sup> to 12<sup>th</sup> October 2015 five weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps of the 05<sup>th</sup> and 11<sup>th</sup> October 2015 are presented in the Figures 1 & 2 below:

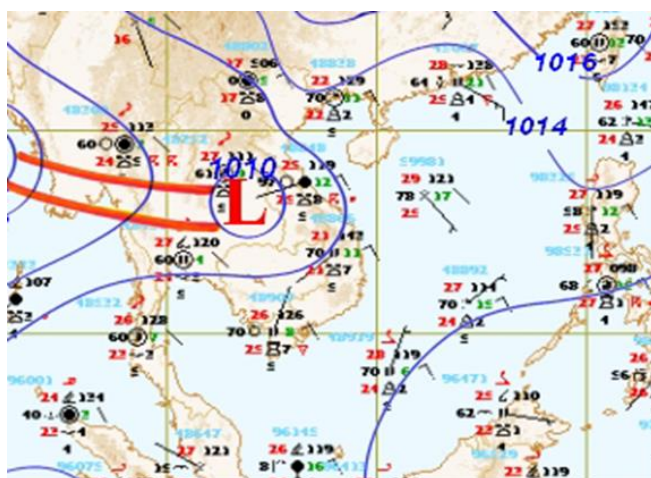

Figure 1: Weather map for 05<sup>th</sup> October 2015

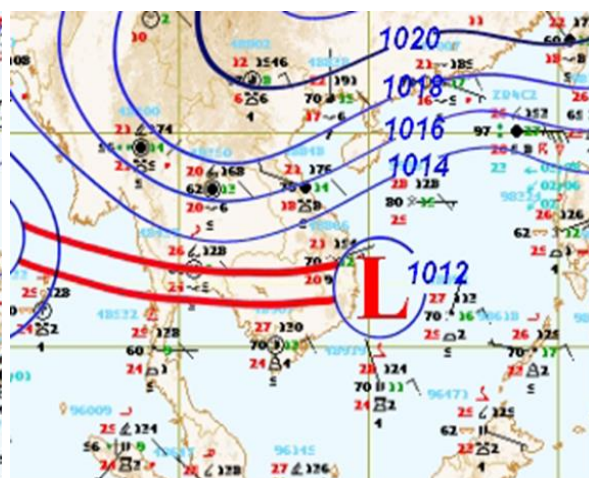

Figure 2: Weather map for 11<sup>th</sup> October 2015

#### Moderate South-West (SW) Monsoon

During the last week, the moderate and weak Southwest monsoon prevailed over the Andaman Sea, the Gulf of Thailand, Thailand and Indochina Peninsular (Figure 1 & Figure 2)

#### Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

Not TD, TS and TY during the last week.

#### Inter Tropical Convergence Zone (ITCZ)

During the last week, the Inter Tropical Convergence Zone (ITCZ) laid across the upper South of Thailand, the Central of Cambodia and the upper South of Viet Nam (Figure 1 and Figure 2).

#### Over weather situation

During the last week, LMB was influenced by SW and ITCZ therefore, scattered moderate rainfall occurred at whole of the Mekong River Basin; see Figure 3 and Table A2 for more detail.

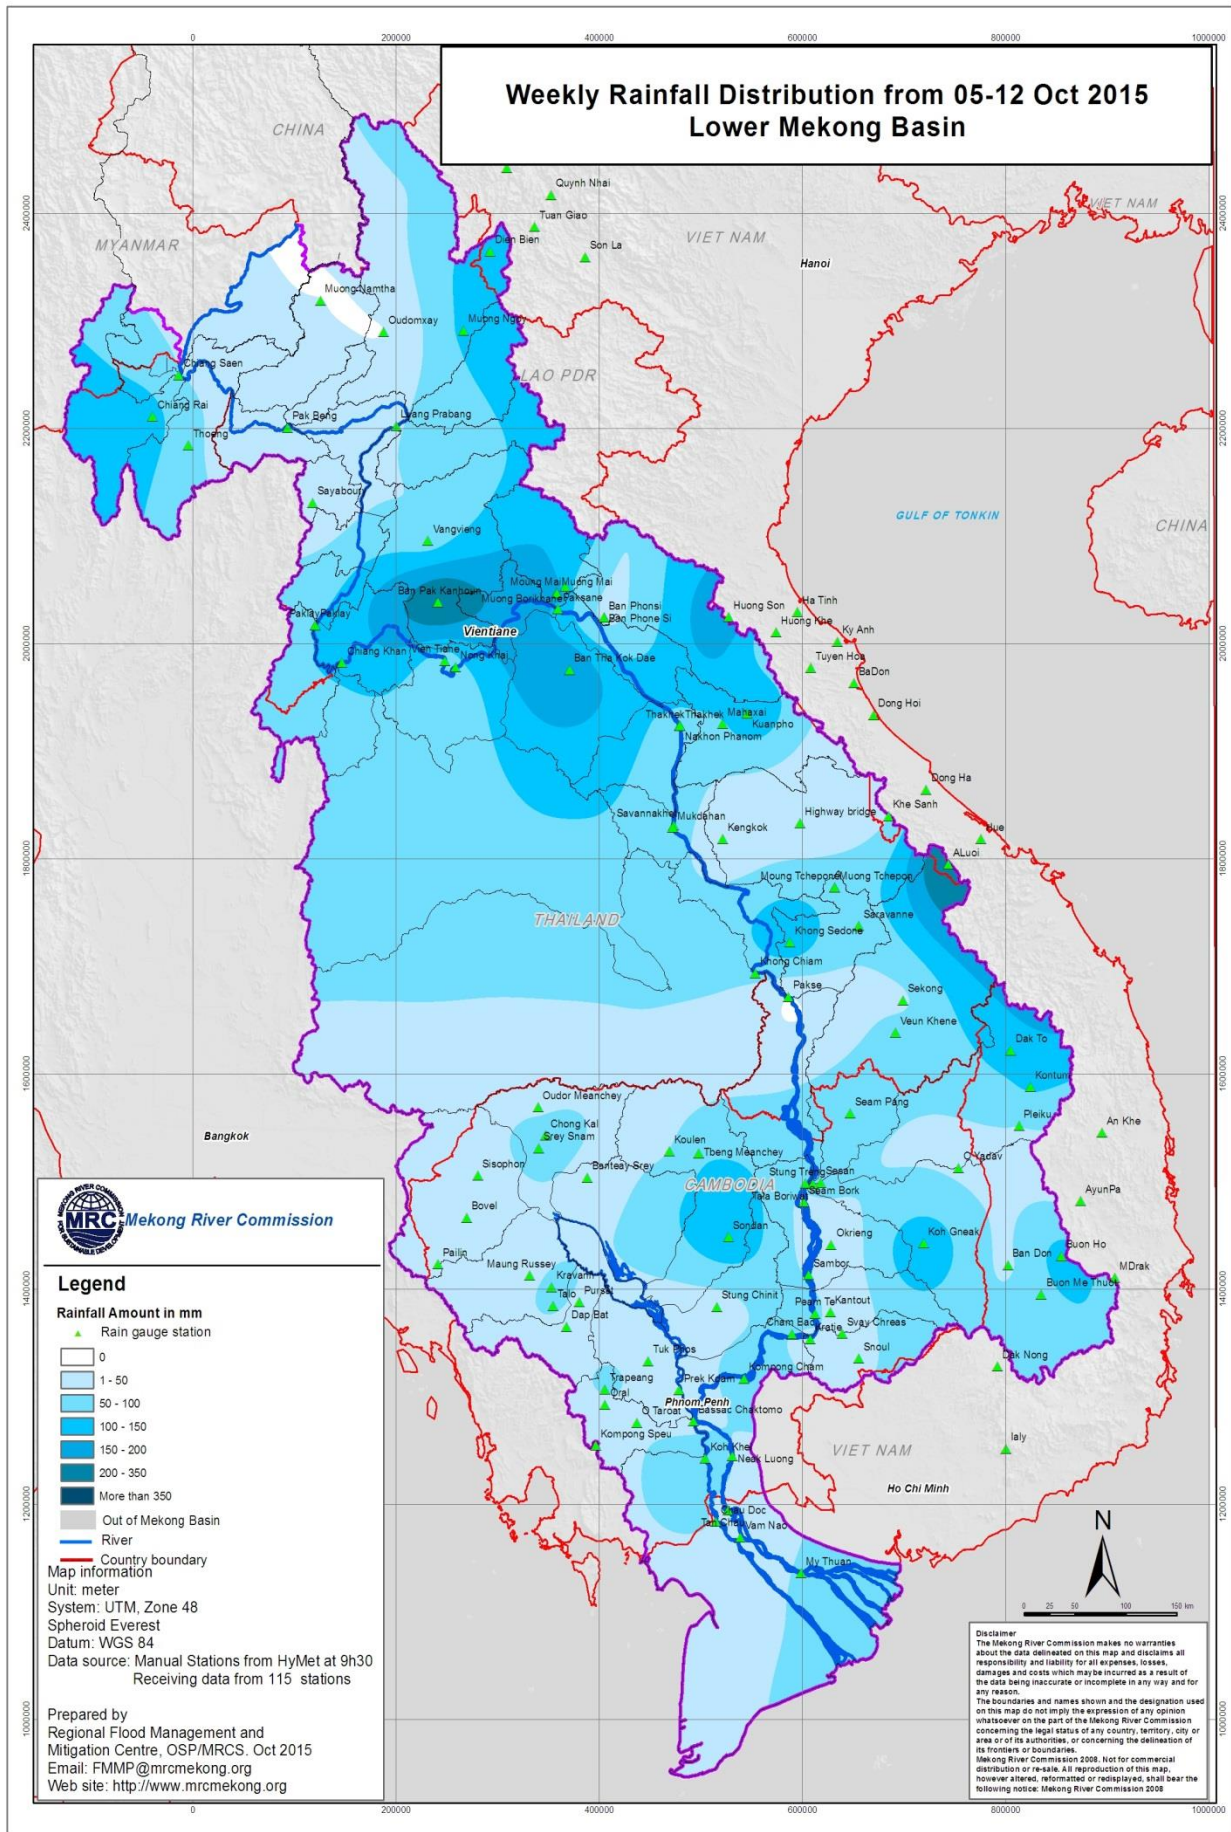

Figure 3: Weekly Rainfall Distribution over the LMB from 05<sup>th</sup> – 12<sup>th</sup> September 2015

### **General behaviour of the Mekong River**

During the last week, the water level of LMB was fluctuating or stabling below the Long Term Average (LTA). Except some stations at upper reach were increasing at the end of last week. See Figure A1 and Figure A2 for more detail.

#### ***For stations from Chiang Saen and Luang Prabang***

Compared to the long term average (LTA), during last week the water levels at these stations were fluctuated below the LTA.

#### ***For stations from Chiang Khan, Vientiane and Nong Khai and Paksane***

Compared to the long term average (LTA), during last week the water levels at these stations were stable below the LTA, except at Paksane was increased on the end of last week.

#### ***For stations from Thakhet/Nakon Phanom to Pakse***

Compared to the long term average (LTA), during last week the water levels at these stations were fluctuated below the LTA.

#### ***For stations from Stung Treng to Kompong Cham***

Compared to the long term average (LTA), during last week the water levels at these stations were decreased below the LTA.

#### ***For stations from Phnom Penh to Koh Khel/Neak Luong***

Compared to the long term average (LTA), during last week the water levels at these stations were stabled below the LTA.

#### ***Tan Chau and Chau Doc***

Compared to the long term average (LTA), during last week the water levels at these stations were stables below the LTA.

**Note:** For areas between forecast stations, please refer to the nearest forecast station.

### **Flood Situation**

- Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

- Damage or victims:

No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the last week.

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

**Annex A: Graphs and Tables**

Table A1: observed water levels

## Annex B: Accuracy and performance

### Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In last week, the overall accuracy is good for 1-day to 5-day forecast lead time at stations in all

of maintains in LMB. However, the accuracies at some stations, such as Luang Prabang, Paksane, Thakhek, Khong Chiam for 4-day, 5-day forecast were less than expected. See Figure B1 and Table B1 for more detail.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge.

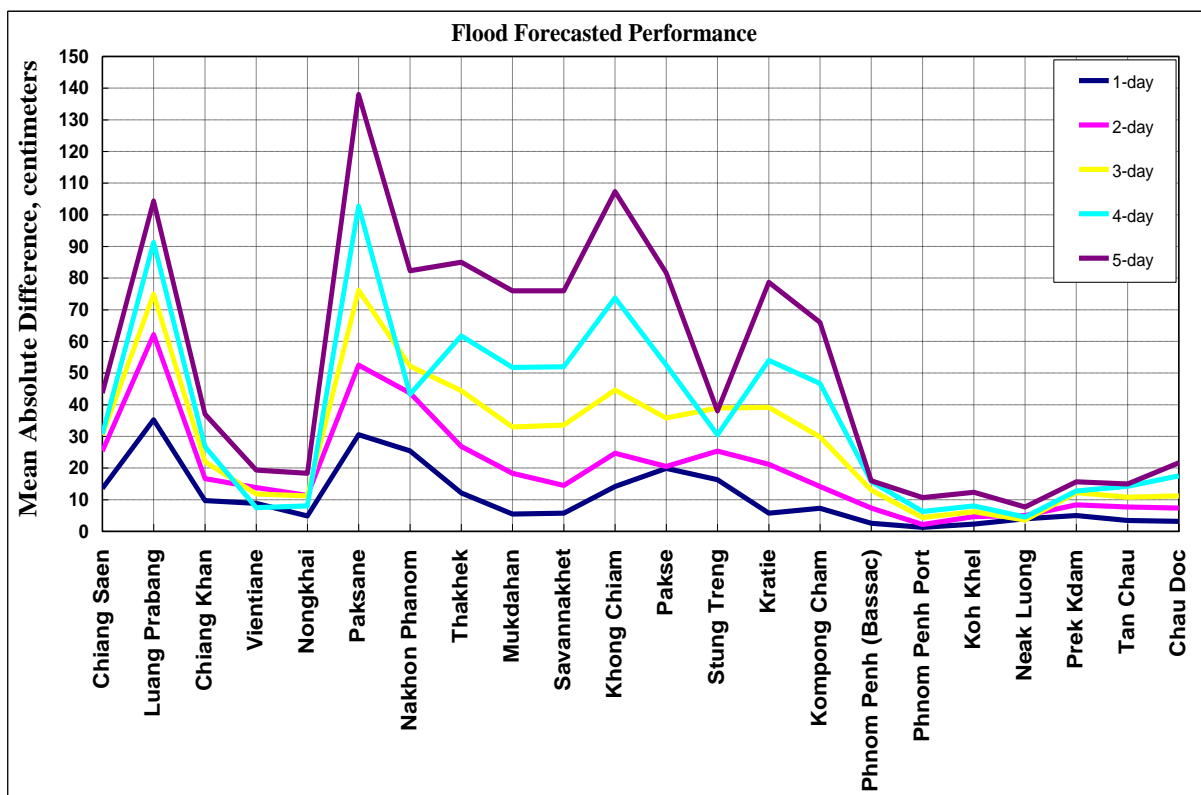

Figure B1: Average flood forecast accuracy along the Mekong mainstream

**Forecast Achievement**

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

Unit in %

	Chiang Saen	Luang Prabang	Chiang Khan	Vientiane	Nongkhai	Paksane	Nakhon Phanom	Thakhek	Mukdahan	Savannakhet	Khong Chiam	Pakse	Stung Treng	Kratie	Kompong Cham	Phnom Penh (Bassac)	Phnom Penh Port	Koh Khel	Neak Luong	Prek Kdam	Tan Chau	Chau Doc	Average

**Note:** An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://fw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

**Performance**

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

	Flood Forecast: time sent				Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)	Weather information available (Number)	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
<b>2015</b>																		
<i>week</i>	10:05	00:00	-	5	08:15	07:38	07:08	07:07	08:44	07:53	07:07	1	0	2	0	143	3	0
<i>month</i>	10:09	00:00	-	04:07	08:15	07:38	07:07	07:08	08:46	07:54	07:07	0	0	2	0	145	3	0
<i>season</i>	10:15	00:00	-	04:35	08:15	07:40	07:19	07:09	08:37	07:43	07:09	17	1	8	14	2907	42	43

*Week* is the week for which this report is made; *Month* is actually the last 30 days (or less if the flood season has just begun); *Season* is the current flood season up to the date of this report.
