

### Weekly Flood Situation Report for the Mekong River Basin

Prepared at: 15/08/2016, covering the week from the 08<sup>th</sup> – 15<sup>th</sup> Aug 2016

#### Weather Patterns, General Behaviour of the Mekong River and Flood Situation

##### General weather patterns

During the week of 08<sup>th</sup> - 15<sup>th</sup> Aug 2016, three weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather charts of the 08<sup>th</sup> August and 02<sup>nd</sup> August are presented in the figures 1 & 2 below:

Figure 1: Weather map for 08<sup>th</sup> August 2016

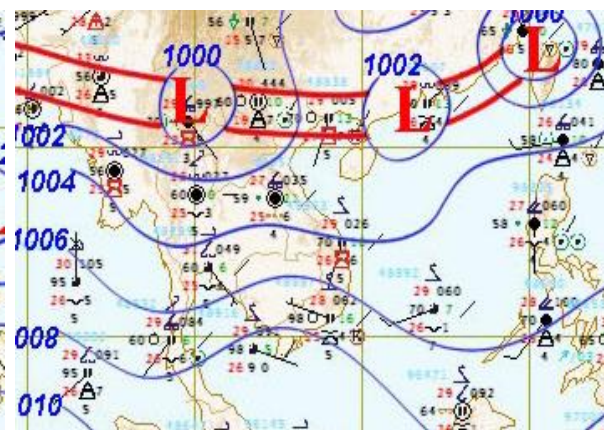

Figure 2: Weather map for 12<sup>nd</sup> August 2016

##### South-West (SW) Monsoon

During the last week, the weak and moderate Southwest monsoon prevails over Andaman Sea, the Gulf of Thailand, Thailand and Indochina Peninsular (Figure 1 and Figure 2)

##### Inter Tropical Convergence Zone (ITCZ)

Starting from 13<sup>rd</sup> August last week, the ITCZ passed across the middle of Myanmar, the upper North of Thailand, the North of Lao PDR and Viet Nam.

##### Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No Tropical Depression (TD) was observed during the last week.

##### Other weather phenomena that affect the discharge

No have other weather phenomena affected to LMB during the last week.

##### Over weather situation

During the last week, the weather was influenced by weak and moderate Southwest monsoon and ITCZ. As a result, moderate and heavy rain occurred in many areas of Lower Mekong Basin; such as the observed of rainfall accumulate during last week at Nakhon Phanom was 378.1 mm, at Thakhek 333.2 mm and at Luang Prabang 212.6 mm. See Figure 3 and Table A2 for more detail.

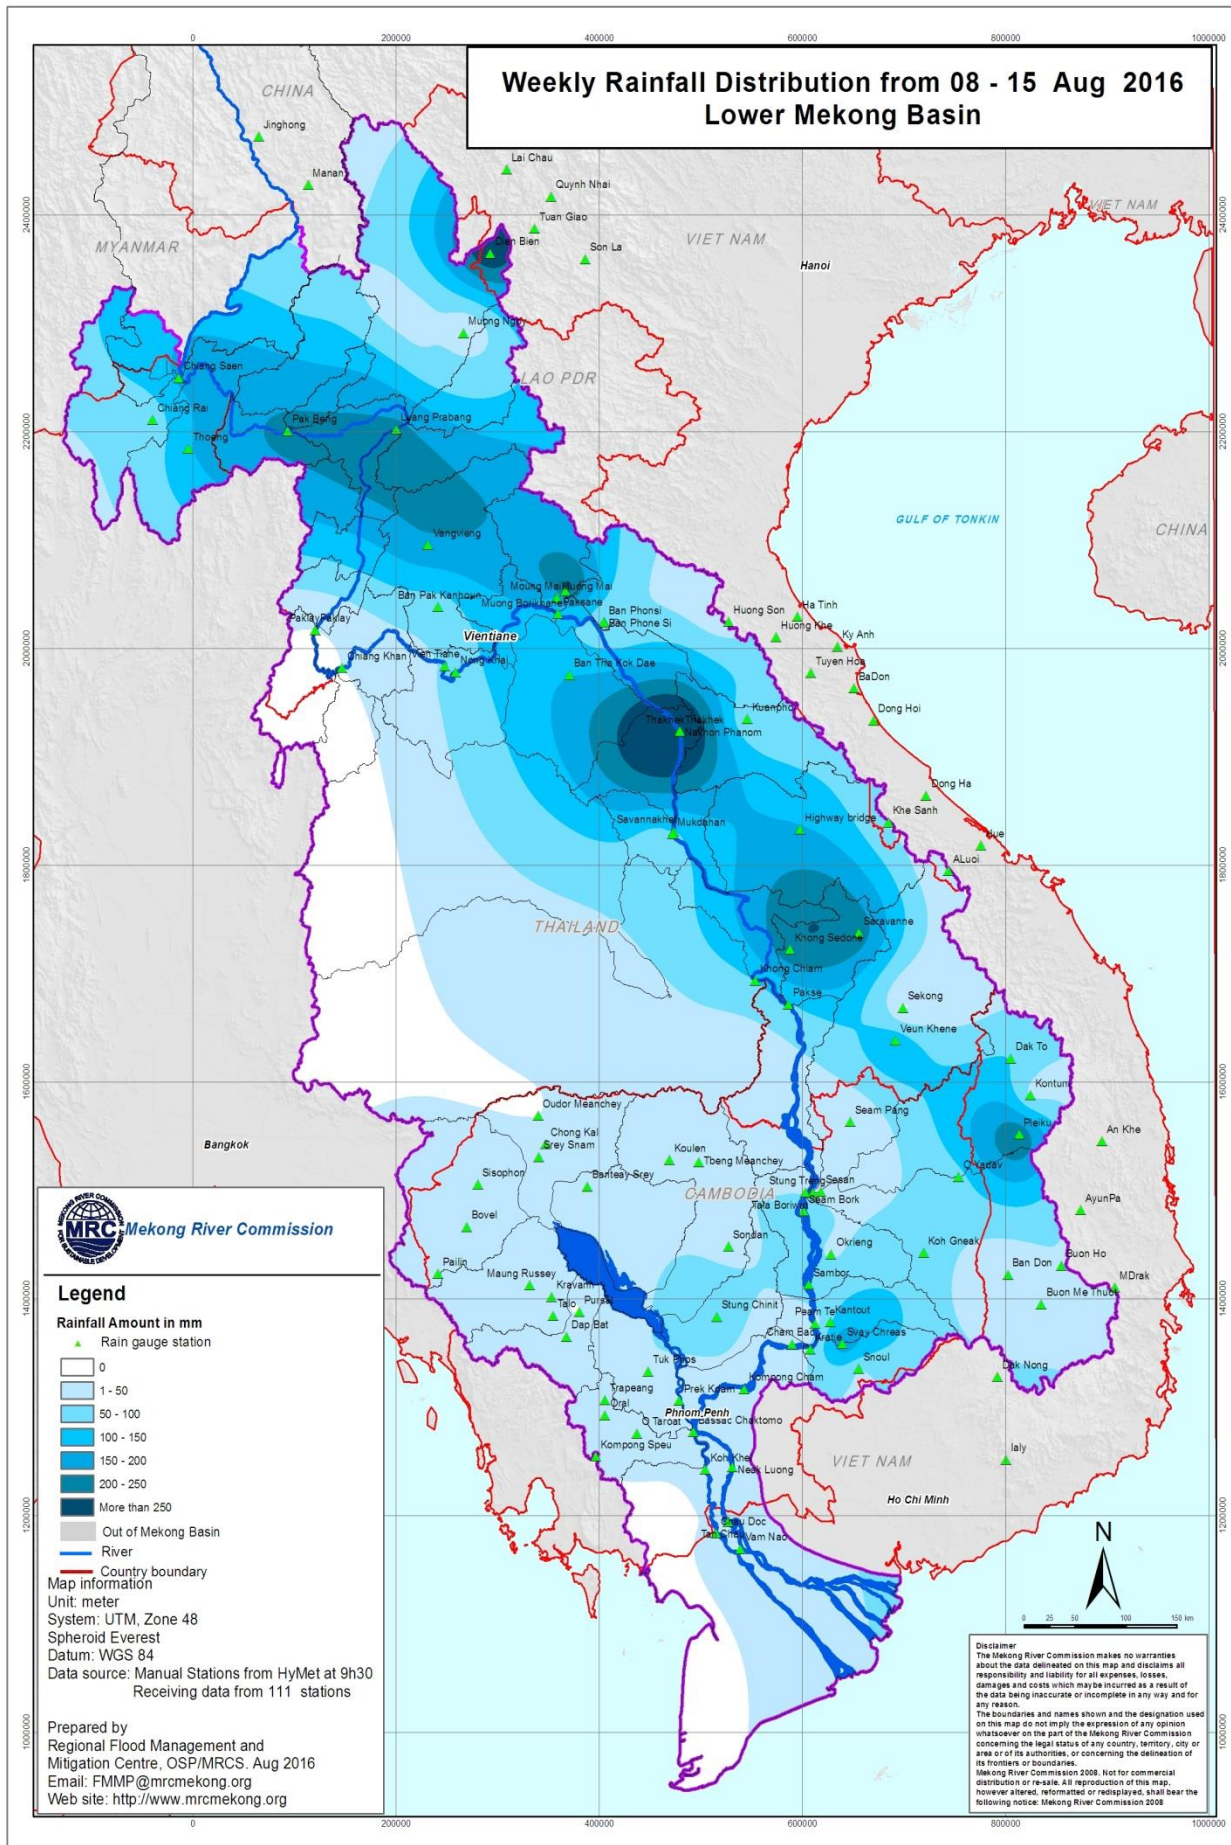

Figure 3: Weekly Rainfall Distribution over the LMB from 08<sup>th</sup> – 15<sup>th</sup> Aug, 2016

### **General behaviour of the Mekong River**

Compared the Long Term Average (LTA), during the last week, the water levels in upper and middle part of LMB have been increasing below the LTA, except Luang Prabang was above the LTA. the downstream part of MLB were fluctuated below the LTA. See Annex C for more detail.

#### ***For stations from Chiang Saen and Luang Prabang***

During the last week, the water levels at these stations have been increasing below the LTA, except Luang Prabang was above the LTA.

#### ***For stations from Chiang Khan, Vientiane and Nong Khai and Paksane***

During the last week the water levels at these stations have been increasing below the LTA.

#### ***For stations from Thakhet/Nakhon Phanom to Pakse***

During the last week, the water levels at these stations have been increasing below the LTA.

#### ***For stations from Stung Treng to Kampong Cham***

During the last week, the water levels at these stations have been increasing or fluctuating below the LTA.

#### ***For stations from Phnom Penh to Koh Khel/Neak Luong***

During the last week, the water levels at these stations were fluctuated below the LTA.

#### ***Tan Chau and Chau Doc***

During the last week, the water levels at these stations were fluctuated below the LTA.

**Note:** For areas between forecast stations, please refer to the nearest forecast station.

### **Flood Situation**

- Flood stage or alarm stage:

No alarm stage (where the forecast is expected to reach flood level within three days) was reported anywhere on the mainstream of the Mekong River during the last week. Water levels were still significantly below flood levels (as defined by the national agency) at all forecast stations.

- Damage or victims:

No damage or loss of life due to river flooding was recorded anywhere along the Mekong River during the last week.

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

**Annex A: Graphs and Tables**

Table A1: observed water levels

## Annex B: Accuracy and performance

### Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is good for 1-day to 5-day forecast lead time at stations in the upper parts of the LMB. However, the accuracies at some stations for 2-day to 5-day

forecast were less than expected such as Luang Prabang, Stung Treng, Kratie Kompong Cham.

The above differences due to two main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge; (3) the heavy rainfall happened in many tributaries inside the LMB. See the Figure B1 and table B1 for more detail.

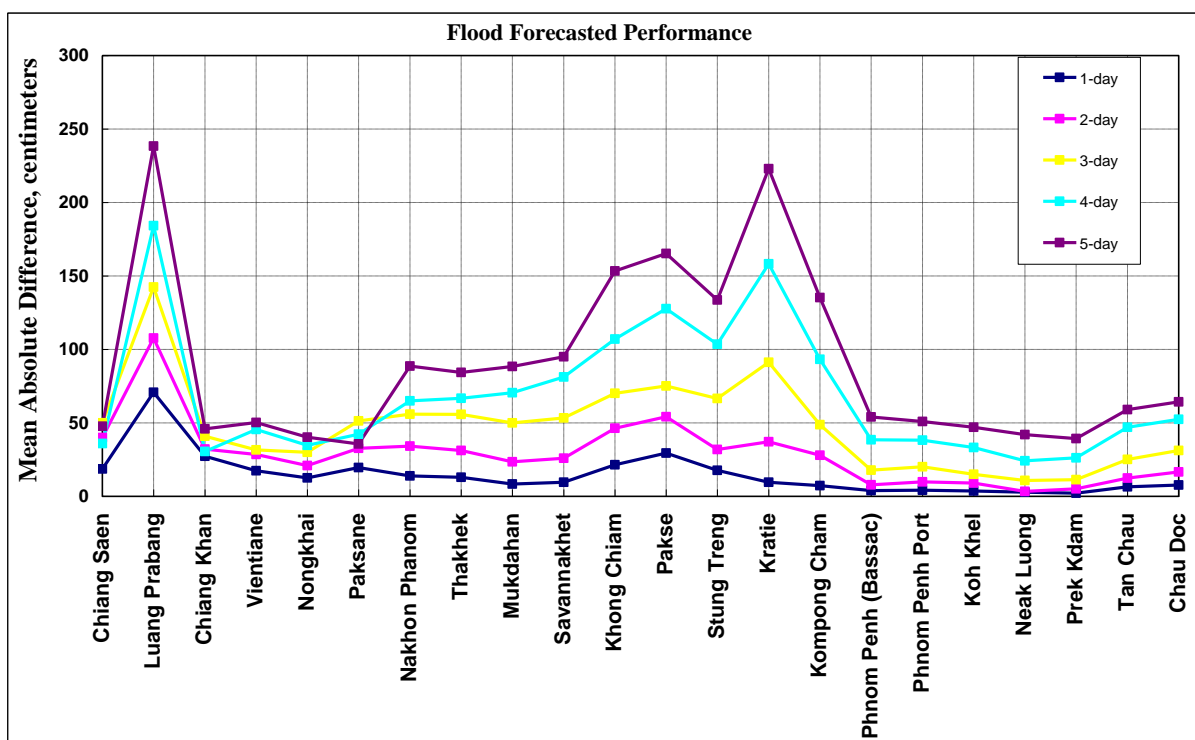

Figure B1: Average flood forecast accuracy along the Mekong mainstream (from 08<sup>st</sup> –15<sup>th</sup> August 2016)

**Forecast Achievement**

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Achievement of daily forecast against benchmarks

Unit in %

Lead time Forecast	Chiang Saen	Luang Prabang	Chiang Khan	Vientiane	Nongkhai	Paksane	Nakhon Phanom	Thakhek	Mukdahan	Savannakhet	Khong Chiam	Pakse	Stung Treng	Kratie	Kompong Cham	Phnom Penh (Bassac)	Phnom Penh Port	Koh Khel	Neak Luong	Prek Kdam	Tan Chau	Chau Doc	Average

**Note:** An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

**Performance**

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 5 days including the current report date

2016	Flood Forecast: time sent				Arrival time of input data (average)							Missing data (number)						
	FF completed and sent (time)	stations without forecast	FF2 completed and sent (time)	Weather information available (Number)	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - NCHMF
<i>week</i>	10:09	00:00	-	-	08:15	07:10	07:51	08:28	08:47	07:55	08:18	0	0	0	34	137	3	0
<i>month</i>	10:07	00:00	-	-	08:15	07:10	07:37	08:09	08:39	07:52	08:11	0	0	1	34	262	3	0
<i>season</i>	10:09	00:00	-	-	08:14	07:11	07:31	07:49	08:50	07:50	07:47	0	0	21	119	2240	24	0

*Week* is the week for which this report is made; *Month* is actually the last 30 days (or less if the flood season has just begun); *Season* is the current flood season up to the date of this report.

Figure B2: Data delivery times for the past 8 days including the current report date

Figure B3: Missing data for the past 8 days including the current report date
