Weekly Flood Situation Report for the Mekong River Basin Prepared at: 21/08/2018, covering the week from the 13th to 20th August 2018

Weather Patterns, General Behaviour of the Mekong River and Flood Situation

General weather patterns

During the week of 13th to 20th August 2018, the weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps were referenced from Thailand Meteorology Department (TMD) of the 15th August and 19th August 2018 in the Figures 1 & 2 as follows:

HINTER DESCRIPTION OF DESCRIPTION OF THE PROPERTY OF THE PROPE

Figure 1: Weather map for 15th August 2018

Figure 2: Weather map for 19th August 2018

Moderate South-West (SW) Monsoon

During the last week, abundant rainfall occurred due to the influential southwest monsoon prevailing over Lower Mekong Basin together with low-pressure air mass cells. (see **Figure 1** and **2**).

<u>Tropical depressions (TD), tropical storms (TS) or typhoons (TY)</u>

No TD, TS or TY was presented in LMB during last week.

Other weather phenomena that affect the discharge

According to the Thai Meteorological Department (TMD), there will influence the prevailing southwest monsoon over Mekong region, including the Gulf of Thailand to become more rainfall. The low pressure was hit the upper part of the Mekong region, during that time (see **Fig.1**).

Over weather situation

During the last week, the weather was scattered thundershowers with moderate rain of the Southwest monsoon. Consequently, in this week there was moderate rainfall over Chiang Sean to Stung Treng catchment areas, included the 3S area. The observed rainfall at Pakseane to Pakse and the 3S area showed high rainfall between 100 mm to 250mm. This was likely caused by the 16th tropical storm of BENICA that hit to the upper lower Mekong Basin. The weekly rainfall distribution is shown in **Figure 3** and daily rainfall at key stations in the Lower Mekong Basin are shown **Table A2**.

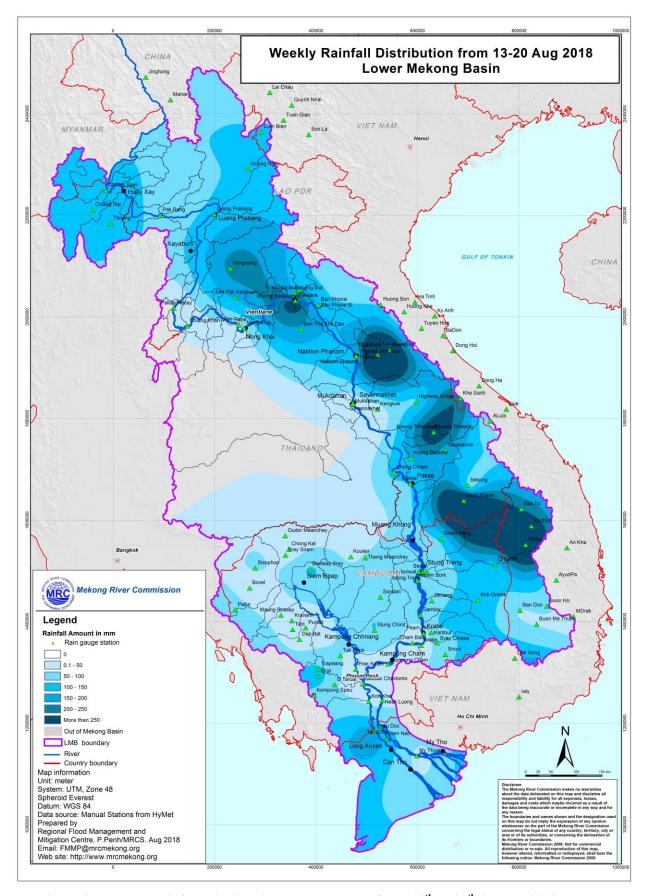

Figure 3: Weekly Rainfall Distribution over the LMB from 13th to 20th August 2018

General behaviour of the Mekong River

During the last week, the water levels at stations from upper to middle part of LMB has been decreasing due to inflow operation upstream part, while at downstream part has been slightly rising.

For stations from Chiang Saen and Luang Prabang

Water levels from 13th-20th August 2018 at Chiang Sean station were fluctuated over its long-term average (LTA), while at Luang Prabang station water levels were rapidly increased from 12.42m on 13th Aug to 16.88 m on 18th August 2018.

For stations from Chiang Khan, Vientiane and Nong Khai and Paksane

Water levels at these stations were reached to the alarm levels at Chiang Khan and Vientiane on 18th and 19th August. At Nong Khai water level were reach to the flood level on 20th August 2018 (12.67 m), while water level at Paksane was almost reached to alarm level on 20th August (13. 81 m).

For stations from Nakon Phanom/Thakhet to Mukdaha/Sovannakhet

Water levels from Nakhon Phanom/Thakhet to Mukdahan/Sovannakhet stations were drastically increased which reached to the flood levels from 13th to 20th August 2018. This caused rising water level was due to the heavy rainfall from Middle part of LMB (BENICA Storm).

For stations from Khong Chiam to Pakse

Water levels from Khong Chiam to Pakse stations were also continued increased, which stay above the alarm levels from 13th to 20th August 2018.

For stations from Stung Treng to Kompong Cham/ Phnom Penh to Koh Khel/Neak Luong

Water levels at these stations were slightly increasing above their LTAs and reached to the alarm levels from 13th to 20th August 2018 at Stung Treng, Kratie, Kompong Cham and Koh Khel.

Tan Chau and Chau Doc

Water level at these 2 tidal stations were also reached to alarm levels from 18th August onward, and it is expected to continue rising over the alarm level next week.

Note: For more detail the flood situation during the last week, please see the hydrographic in Annex C.

Flood Situation

• Flood stage or alarm stage:

The alarm and flood levels appeared at Chiang Khan, Vietnaine, Nong Khai, Pasksane, Nakhon Phanom, Thakhet, Mudahan, Khong Chiam, Pakse, Stung Treng, Kratie, Kompong Cham, Koh Khel, Tan Chau and Chau Doc. However, the water levels have been gradually decreased and reached to the lower flood levels from next week.

No damage or victims were reported by the Mekong member countries

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

Annex B: Accuracy and performance

Accuracy

"Accuracy" describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is fair for 1-day to 5-day forecast lead time at stations in the upper and lower parts of the LMB. However,

the accuracies at upper and middle reaches of the LMB stations from Chaing Sean to Nongkhai stations for 4-day to 5-day forecast were considered large.

The above differences due to three main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge; and (3) the forecasted accumulated rainfall was not well represented.

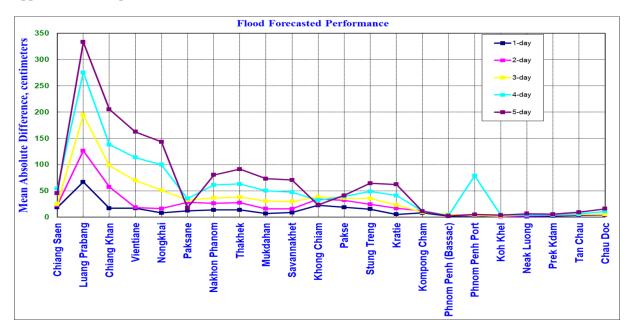

Figure B1: Average flood forecast accuracy along the Mekong mainstream

Forecast Achievement

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2). Table B1: Evaluation performance forecasting (from 13th to 20th Aug 2018) base on New Benchmark (%).

Note: An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (http://ffw.mrcmekong.org/accuracy.htm).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 7 days including the current report date

		FF 1	time sent	t			Arr	ival time	of input	data				Miss	ing data	(number-	mainstre	am and	trib.st.)
