

### Weekly Flood Situation Report for the Mekong River Basin

Prepared at: 04/09/2018, covering the week from the 27<sup>th</sup> August to 03<sup>rd</sup> September 2018

### Weather Patterns, General Behaviour of the Mekong River and Flood Situation

#### General weather patterns

During the week of 27<sup>th</sup> August to 03 September 2018, the weather bulletins were issued by the Department of Meteorology (DOM) of Cambodia. The weather maps were referenced from Thailand Meteorology Department (TMD) of the 29<sup>th</sup> August and 01<sup>st</sup> September 2018 in the Figures 1 & 2 as follows:

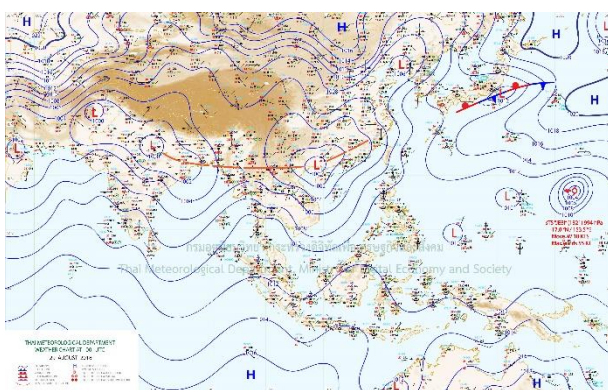

Figure 1: Weather map for 29<sup>th</sup> August 2018

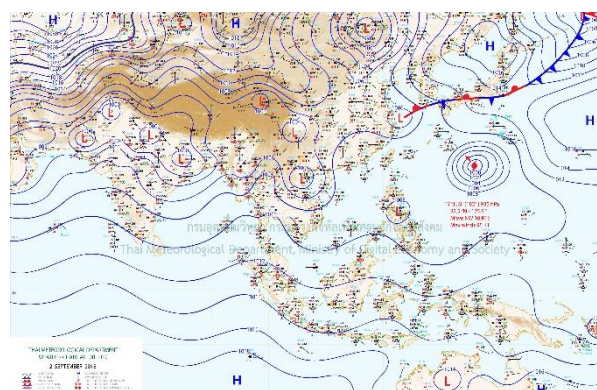

Figure 2: Weather map for 01<sup>st</sup> Sept 2018

#### Moderate South-West (SW) Monsoon

During the last week, the low pressure was nominated the upper part of the Lower Mekong Basin which resulted in abundant rainfall occurred. (see **Figure 1** and **2**).

#### Tropical depressions (TD), tropical storms (TS) or typhoons (TY)

No TD, TS or TY was presented in LMB during last week.

#### Other weather phenomena that affect the discharge

According to the Thai Meteorological Department (TMD), there will influence the prevailing southwest monsoon over Mekong region, including the Gulf of Thailand to become more rainfall. The low pressure was hit the upper part of the Mekong region, during that time (see **Fig.1**).

#### Over weather situation

During last week, the weather was scattered thundershowers with moderate rain of the Southwest monsoon. Consequently, in this week there was moderate rainfall covered from upper part of Luang Prabang and Vientiane to Khong Chaim and Pakse. The observed rainfall at Paksane to Pakse and the 3S area showed high rainfall between 100 mm to 250mm. The weekly rainfall distribution is shown in **Figure 3** and daily rainfall at key stations in the Lower Mekong Basin are shown **Table A2**.

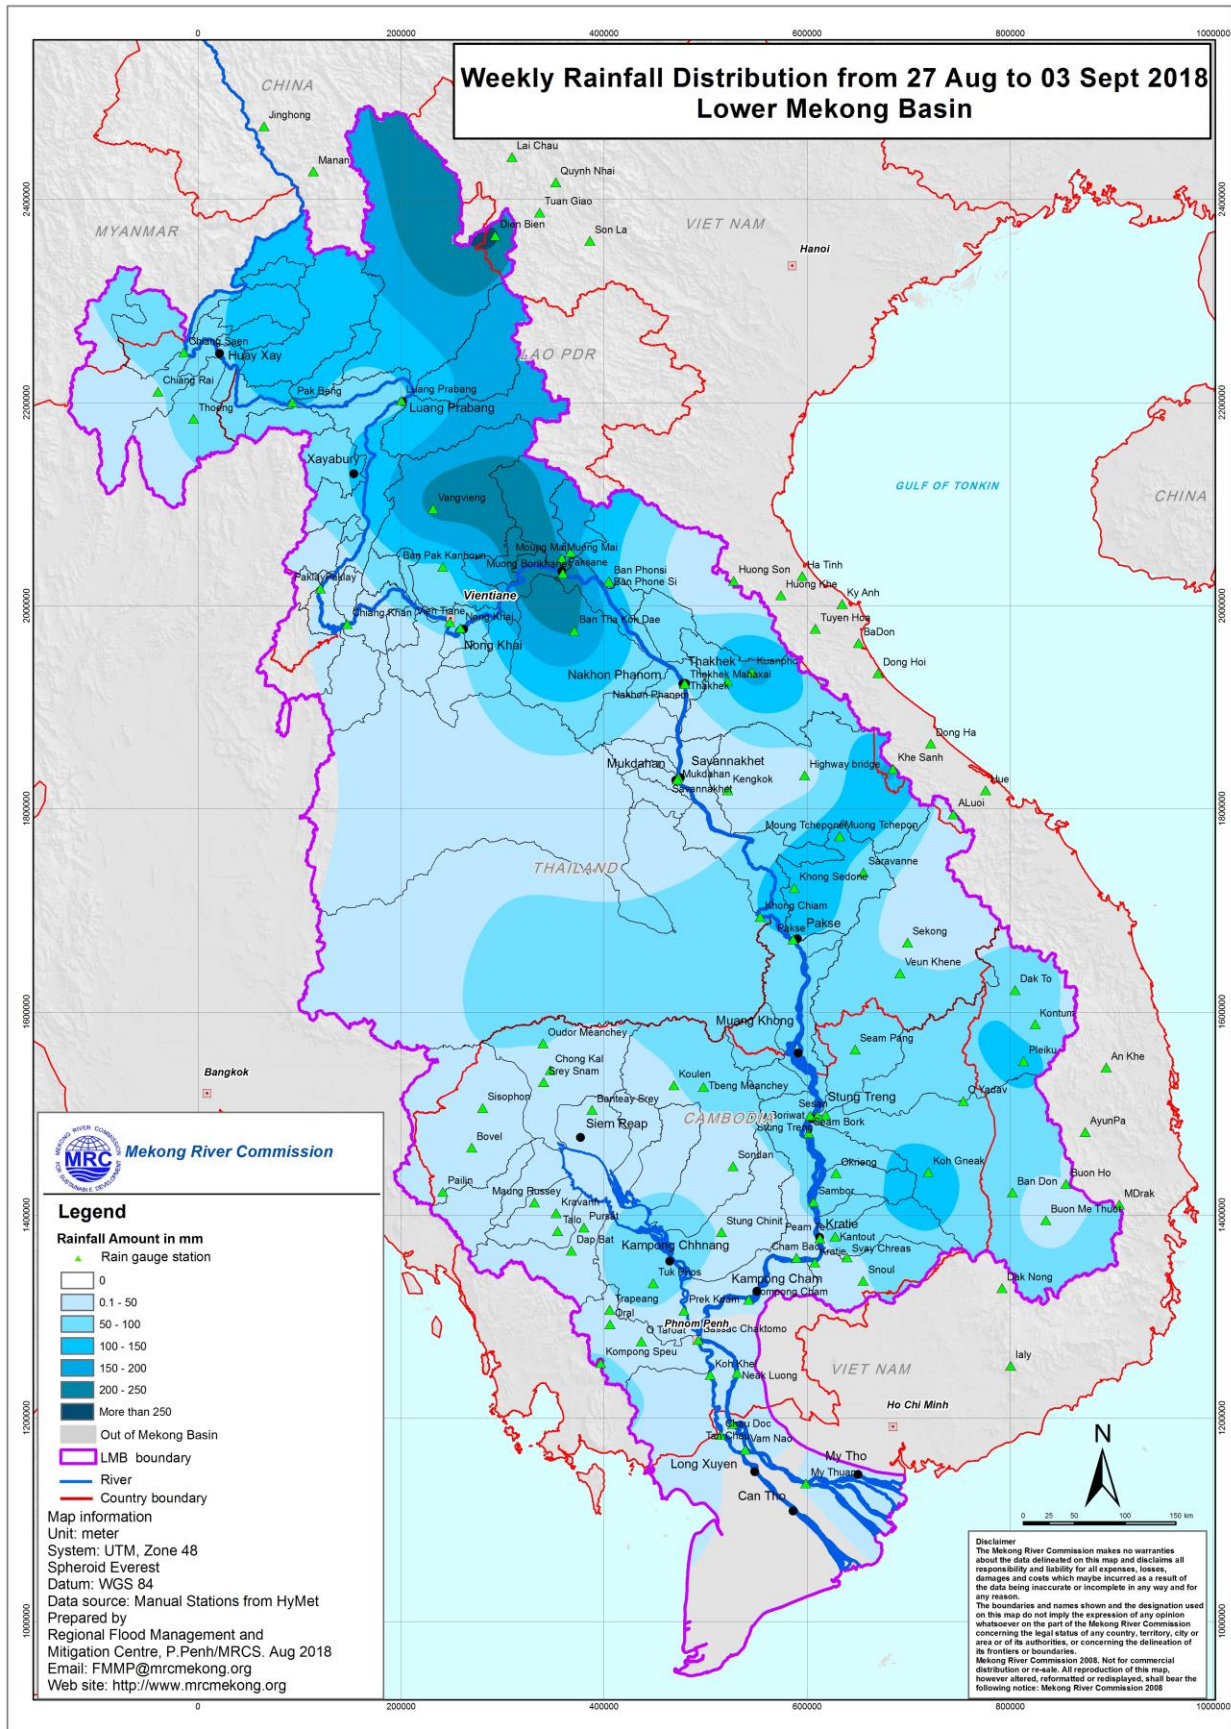

Figure 3: Weekly Rainfall Distribution over the LMB from 27<sup>th</sup> August to 03<sup>rd</sup> September 2018

## **General behaviour of the Mekong River**

During the last week, the water levels at stations from upper to middle part of LMB has been decreasing due to inflow operation upstream part, while at downstream part has been slightly rising.

### ***For stations from Chiang Saen and Luang Prabang***

Water levels from 27<sup>th</sup> August to 03<sup>rd</sup> September 2018 at Chiang Saen station were fluctuated over its long-term average (LTA), while at Luang Prabang station water levels were likely nominated by hydro power dam operation upstream due to the increased water level from 31<sup>th</sup> August to 1<sup>st</sup> September 2018 varied from 14.75m on to 17.26 m.

### ***For stations from Chiang Khan, Vientiane and Nong Khai and Paksane***

Water levels at these stations were continued to reach to the alarm levels at Chiang Khan and Vientiane on from 20<sup>th</sup> August to 3<sup>rd</sup> September were reached to the alarm level on 2<sup>nd</sup> September for Chiang Khan (16.65) and 03<sup>rd</sup> September 2018 (14.96 m). Water level at Nong Khai was reached to the flood level on 2<sup>nd</sup> September (12.32 m) and continued further in next week.

### ***For stations from Nakhon Phanom/Thakhet to Mukdahan/Sovannakhet***

Water levels from Nakhon Phanom/Thakhet to Mukdahan/Sovannakhet stations were continued to increase since a week before, resulted water level maintained to the flood levels from 27<sup>th</sup> August to 3<sup>rd</sup> September 2018. This caused rising water level was due to the heavy rainfall from Middle part of LMB, due to the low-pressure effect rainfall (see Fig. 3).

### ***For stations from Khong Chiam to Pakse***

Water levels from Khong Chiam to Pakse stations were remained over the flood level up to 2<sup>nd</sup> September 2018.

### ***For stations from Stung Treng to Kompong Cham/ Phnom Penh to Koh Khel/Neak Luong***

Water levels at at Stung Treng, Kratie, Kompong Cham and Phnom Penh stations were slightly increased from 27<sup>th</sup> to 31<sup>th</sup> August and decreased gradually from 1<sup>st</sup> September 2018. However, water level at Koh Khel were remained over the alarm levels.

### ***Tan Chau and Chau Doc***

Water level at these 2 tidal stations were also maintained over the alarm levels from 27<sup>th</sup> August to date, and it is expected to continue rising over their alarm levels next week.

**Note:** For more detail the flood situation during the last week, please see the hydrographic in Annex C.

## **Flood Situation**

- Flood stage or alarm stage:

This week the flood situation was happened at Nong Khai, Paksane, Nakhon Phanom, Mukdahan, Khong Chiam and Pakse.

- No damage or victims were reported by the Mekong member countries

For more details see the following annexes:

- tables and graphs for water level and rainfall for the last week in Annex A
- a graph for accuracy in Annex B
- a table of forecast achievement in Annex B
- tables and graphs for performance in Annex B
- the water level graphs showing the observed water level for the season in Annex C

**Annex A: Graphs and Tables**

Table A1: observed water levels

## Annex B: Accuracy and performance

### Accuracy

“Accuracy” describes the accuracy of the adjusted and published forecast, based on the results of the MRC Mekong Flood Forecasting System, which are then adjusted by the Flood Forecaster in Charge taking into consideration known biases in input data and his/her knowledge of the response of the model system and the hydrology of the Mekong River Basin. The information is presented as a graph below, showing the average flood forecasting accuracy along the Mekong mainstream.

In general, the overall accuracy is fair for 1-day to 5-day forecast lead time at stations in the upper and lower parts of the LMB. However,

the accuracies at upper and middle reaches of the LMB stations from Chiang Sean to Savannakhet stations for 4-day to 5-day forecast were considered large.

The above differences due to three main factors: (1) internal model functionality in forecasting; for which the parameter adjustment in the model is not possible especially at stations in the upper part and in the Mekong delta where are affected by tidal; (2) the adjustment by utilizing the practical knowledge and experience of flood forecaster-in-charge; and (3) the forecasted accumulated rainfall was not well represented.

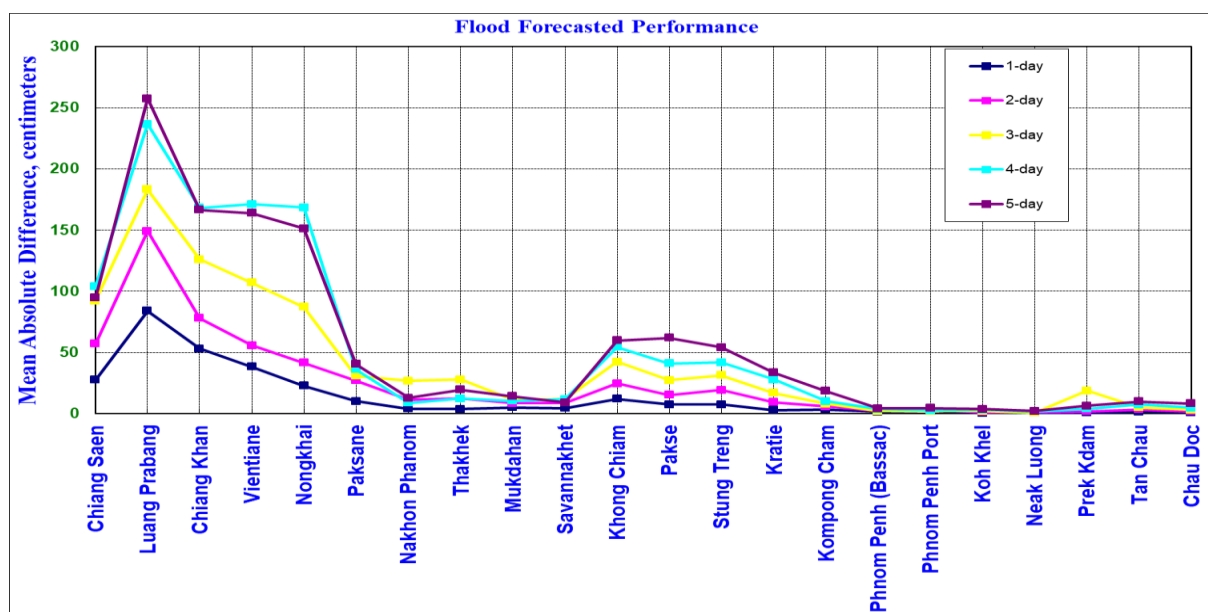

Figure B1: Average flood forecast accuracy along the Mekong mainstream

**Forecast Achievement**

The forecast achievement indicates the % of days that the forecast at a particular station for a lead-time is successful against a respective benchmark (Table B2).

Table B1: Evaluation performance forecasting (from 27<sup>th</sup> Aug to 3<sup>rd</sup> September 2018) base on New Benchmark (%).

**Note:** An indication of the accuracy given in the Table B2 is based on the performance of the forecast made in 2008 from the new flood forecasting system and the configuration for the 2009 flood season and is published on the website of MRC (<http://ffw.mrcmekong.org/accuracy.htm>).

A new set of performance indicators that is established by combining international standards and the specific circumstances in the Mekong River Basin, is applied officially for the flood season of 2011 onward.

## Performance

Performance is assessed by evaluating a number of performance indicators, see table and graphs below:

Table B3: Overview of performance indicators for the past 7 days including the current report date

2018	FF time sent				Arrival time of input data								Missing data (number-mainstream and trib.st.)							
	FF completed and sent (time)	Stations without forecast	FF2 completed and sent (time)	Weather data available (time)	NOAA data	China	Cambodia - DHRW	Cambodia - DOM	Lao PDR - DMH	Thailand - DWR	Viet Nam - SRHMC	Viet Nam - HMS	NOAA data/2dataset	China/2	Cambodia - DHRW/15	Cambodia - DOM/34	Lao PDR - DMH/32	Thailand - DWR/13	Viet Nam - SRHMC/6	Viet Nam - HMS/39
